

MEETING

STATE OF CALIFORNIA

DEPARTMENT OF TOXIC SUBSTANCES CONTROL

**GREEN RIBBON SCIENCE PANEL**

CalEPA HEADQUARTERS BUILDING

KLAMATH ROOM, SECOND FLOOR

1001 I STREET

SACRAMENTO, CALIFORNIA

TUESDAY, FEBRUARY 13, 2018

8:44 A.M.

## APPEARANCES

### PANEL MEMBERS PRESENT

Arthur Fong, Ph.D., Co-Chair  
Kelly D. Moran, Ph.D., Co-Chair  
Elaine Cohen-Hubal, Ph.D.  
Ann Blake, Ph.D.  
Jack Linard, Ph.D.  
Kenneth Geiser, Ph.D.  
Michael Caringello, MBA  
Julie M. Schoenung, Ph.D.  
Helen Holder  
Rebecca Sutton, Ph.D.  
Mark Nicas, Ph.D.

### DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC)

Marcus Simpson  
Meredith Williams, Ph.D., SPWP Deputy Director  
Karl Palmer, SPWP Branch Chief  
Robert Brushia, Ph.D.

MR. SIMPSON: Good morning, folks, and thank you for joining us today. My name is Marcus Simpson, and I work with DTSC's Office of Public Participation, and on behalf of the Department, I want to extend a warm welcome to everyone.

I also want to say welcome back to the panel members. Thank you for being here again. We hope you all had an excellent and restful night. I know we had a lot of lively and productive discussion yesterday, and we're hoping for much the same today.

So, if you are just joining us today for the first time, and you weren't here yesterday, I'd like to ask if you could please take a glance to the back of the room and find the exits. In the event that we have a fire alarm or any other reason that we need to quickly evacuate, those will be where we head for.

I would ask that everyone please grab your valuables and, as safely and as orderly as possible, just head for those exits. When you make it outside of the room, please do not use the elevators. Rather, let's take the stairways. Thank you.

Before we get underway with panel discussion and presentations today, just a couple of quick housekeeping announcements. I'd ask that you please bear with me. The restrooms are located just outside the room, in the main

1 hallway. The water fountains are also located there. We  
2 also have additional restrooms on the second floor, just  
3 across the bridge and the breezeway, just past the Byron  
4 Sher Auditorium.

5 So I want to let you guys know that today's  
6 discussion is subject to the Bagley-Keene Open Meeting Act.  
7 We want to maintain public transparency and access to the  
8 discussion.

9 In addition to those of us here present in the  
10 room today, we are broadcasting this meeting via the Web.  
11 For those of you that may be tuning in from your offices or  
12 your home, welcome. Thank you for joining us.

13 Throughout the course of the day, if you have any  
14 input you'd like to provide, we would ask that you please e-  
15 mail saferconsumerproducts@dtsc.ca.gov. Once again,  
16 saferconsumerproducts@dtsc.ca.gov.

17 We have a court reporter here taking a transcript  
18 of today's discussion, and once it's prepared for DTSC, we  
19 will make it available on our web site.

20 So I appreciate your attention. Thank you for  
21 bearing with me. If there's anything that I can do to help  
22 today's event turn out that much better, to provide  
23 information, if you have questions, please don't hesitate to  
24 grab my attention and let me know. Okay? So thank you  
25 much. I'd like to turn it over to our co-Chairs, Kelly and

1 Art, and have a good one. Thank you very much for your  
2 help.

3 PANEL CO-CHAIR FONG: Good morning, panel members.  
4 I though we just had a really productive day yesterday, and  
5 when I spoke to the staff members afterwards, they told me  
6 that, you know, your comments were really informative and  
7 insightful, and so thank you very much for sharing your  
8 experience and expertise.

9 Today we'll start the meeting with a presentation  
10 from Rob on the development of the 2018-to-2020 Priority  
11 Product Work Plan, after which the panel will be given the  
12 opportunity to ask clarifying questions, and that will be  
13 followed by a public comment today on today's agenda, after  
14 which we'll switch gears and -- I'm sorry.

15 We'll have a panel discussion on the Work Plan.  
16 Then we'll switch gears and close today's hearing with a  
17 panel discussion on how DTSC can engage the research  
18 community on research topics that address specific program  
19 and state code leads.

20 And, Kelly, do you have any -- Meredith.

21 DEPUTY DIRECTOR WILLIAMS: Good morning. Well, I  
22 want to just echo what -- thank you. I want to echo what  
23 Art said, which is simply that, as I've talked to staff, and  
24 my observations throughout the day, it's clear that the  
25 input you provided yesterday was very much "Goldilocks." It

1 was just right.

2           It was not too abstract, so that we didn't know  
3 how to take it and put it in the context of what we're  
4 trying to do. It was not too "down in the weeds" so that,  
5 you know, we were just spinning around some little piece of  
6 what we're trying to do and not looking at the big picture.

7           It had a breadth to it, and, as a result, I think  
8 lots of us said, "Okay. That's a to-do," and there was a  
9 direct translation from the input you provided to what we  
10 can do to continue to implement the regulations. So we were  
11 very pleased with yesterday's session, and look forward to  
12 today's discussion of the Work Plan and the future. Thank  
13 you.

14           PANEL CO-CHAIR FONG: Thank you very much.

15           Now Rob is going to give us a presentation on the  
16 development of the 2018-to-2020 Priority Product Work Plan.

17           Rob.

18           MR. BRUSHIA: Thank you, and good morning once  
19 again, and thank you all for joining us.

20           It is my pleasure to be able to introduce to you  
21 the 2018-to-2020 Priority Product Work Plan, because we have  
22 been working very hard on it the last few months, and we're  
23 eager to get it done, and out for public comment and review,  
24 and last week we did make it publicly available via our  
25 CalSAFER web site.

1           There's a public comment period that has begun.  
2   It's going to run into March. I'm going to have a little  
3   bit more detail later on in the meeting on how the public  
4   can participate and provide comment to us, and I believe all  
5   of you received a copy of it last week. So, hopefully,  
6   you've had a chance to go over it because, in 10 minutes, I  
7   can't really delve too deep into it. What I'm going to try  
8   to do is give you an overview of the Work Plan, and then try  
9   to summarize for you how this Work Plan differs from our  
10   last Work Plan.

11           Okay. So just a refresher. What is the Work  
12   Plan? The Work Plan is a document that basically describes  
13   all the product categories we are going to evaluate over the  
14   next three years.

15           The Safer Consumer Product regulations require us  
16   to prepare a Work Plan every three years. It sets forth  
17   these product categories, and we will evaluate those product  
18   categories to identify product-chemical combinations are  
19   potential priority products.

20           Okay. The work plan also explains the policy  
21   priorities we relied upon in selecting product categories  
22   for the Work Plan, and gives a general explanation of how we  
23   selected the product categories.

24           What it doesn't do is, it does not name specific  
25   product-chemical combinations, and it does not create any

1 legal obligations for any stakeholders. It is simply a  
2 document that frames our decision making for priority  
3 product selection. Okay.

4 So our approach in developing this work plan was  
5 to engage a number of stakeholders. We had a public comment  
6 period last fall, and we received quite a few comments. We  
7 also actively engaged various other state agencies, boards,  
8 departments, and offices, as well as the U.S. EPA.

9 We also used our discretion to develop some  
10 program goals, and then to develop some policy statements  
11 that support those program goals, and I'm going to go over  
12 those in just a minute with you, and then we also looked at,  
13 you know, the work we had been doing in our last Work Plan,  
14 and what we wanted to continue on with out of that Work  
15 Plan. Okay.

16 So, as I just mentioned, we used our discretion to  
17 develop some policy statements and some policy goals, and  
18 the goals are actually highlighted here in green, and they  
19 were to protect children, to protect our valuable and  
20 limited water resources and aquatic ecosystems, to address  
21 chemicals in our indoor environment, and to address  
22 chemicals that may migrate into food from food packaging.

23 We then, after developing those goals, developed  
24 the policy statement shown here, and there's more detail on  
25 each of these in the Work Plan itself, but we developed

1 these policy statements, and all the product categories that  
2 we selected in this work plan that we proposed, including  
3 this work plan, are supported by these policy statements.

4 Okay. So now I'm going to describe to you  
5 how -- I'm going to describe to you the new product  
6 categories that we propose, including in the new Work Plan,  
7 and how they differ from our 2015-2017 Work Plan. Okay.

8 This slide shows the product categories that were  
9 in our 2015-2017 Work Plan. Okay. We plan to retain some  
10 of these, but we also propose eliminating two, and they are  
11 fishing and angling equipment and clothing. We may revisit  
12 them in the future, but, for now, we don't intend to put  
13 those in new Work Plan. Okay.

14 This next slide I'm going to spend several minutes  
15 on, and I'm going to describe to you the product categories  
16 that we retained, or that we propose retaining, from the old  
17 Work Plan, as well as the new product categories that we  
18 described for this Work Plan.

19 The first one I'm going to talk about are shown  
20 here, the beauty, personal care, and hygiene products, and  
21 clothing. These product categories would be retained, and  
22 named exactly as they were in the previous work plan. The  
23 only thing that would change with respect to these is, we  
24 chose to revise the product category descriptions -- drink  
25 of water, real quick, my throat -- okay.

1           We chose to revise the descriptions for these  
2 product categories because we wanted to enhance clarity  
3 regarding what might be included in these particular product  
4 categories, but the scope, also, we don't believe is  
5 changing. Okay. So these product categories would be very  
6 similar to what was in the last Work Plan.

7           The next three were also from the last Work Plan,  
8 but for these, we decided to change both the name of the  
9 category as well as the product description and the scope of  
10 the category. So, in the case of furnishings, I don't know  
11 if folks can -- folks on the webcast probably can't see  
12 this, but, "Furnishings," there's a picture of a chair. In  
13 the case of this category, the old category in the 2015-2017  
14 Work Plan was called "Household, Office Furniture, and  
15 Furnishings," and where we got that name from was the Global  
16 Product Classification System.

17           In our experience, implementing the last Work  
18 Plan, we learned that that classification system isn't  
19 really the best fit for our product categories, and so we  
20 decided to move away from it. We decided to revise the name  
21 and the description -- you can read more detail about it in  
22 the Work Plan -- and then, again, we decided to change the  
23 scope of this category as well.

24           In the old work plan, this product category was  
25 limited to only furnishings that contain flame retardants or

1 stain-resistant chemicals, and we propose removing that  
2 restriction, and the reason that we are making that proposal  
3 is because, again, during our experience implementing the  
4 last Work Plan, we learned about some other chemicals that  
5 may also present a potential for exposures in the indoor  
6 environment, and we'd like the ability to address those, you  
7 know, to further evaluate those chemicals, and potentially  
8 address them as well.

9           Another thing that we did is, we added the term  
10 "décor" into the name of this category, and we also added  
11 the term "school." We just wanted to emphasize that we're  
12 talking about furnishings in all structures that basically  
13 are intended to human habitation, and we added the word  
14 "décor" because we wanted to emphasize also that certain  
15 product categories that we might not typically think of as  
16 furnishings, such as curtains, for example, are actually  
17 included in this category. Okay.

18           Now, regarding building materials, which is shown  
19 right here with the paintbrush, that category in the old  
20 Work Plan was simply called "Building Products," and the  
21 category was restricted to paint products, adhesives,  
22 sealants, and floorings.

23           Again, we propose changing the name to the name  
24 that you see here on the slide, and we also propose removing  
25 that restriction. We propose the revision to the name and

1 the product category description just, again, to enhance  
2 clarity, so that we hope we provide a better description of  
3 what it is we're talking about looking at, but, in removing  
4 the scope, the reason that we're doing that is because we  
5 know that there's a tremendous amount of effort in this  
6 sector in terms of looking for greener alternatives, and we  
7 want to explore what we can do to encourage the development  
8 and use of those alternatives in a wide variety of products  
9 that might fit within this category. Okay.

10 For office supplies, in the old Work Plan, this  
11 was called "Office Machinery and Consumables," and it was a  
12 bit confusing because we really didn't intend, I don't  
13 think, to address just machinery. In fact, we didn't intend  
14 to address machinery at all. We really wanted to address  
15 consumable office products.

16 So, again, we decided to revise the name, as shown  
17 here on the slide. Again, we added the term "school,"  
18 because we wanted to specify that this -- you know, some of  
19 these consumables are also used in schools, by children.  
20 Okay.

21 We learned from our work on the last Work Plan  
22 that the -- excuse me, I'm sorry -- that the old name really  
23 didn't capture adequately all the categories that we were  
24 interested in evaluating, and that's again why we decided to  
25 change the name and the product description.

1           Okay. Let's move on. Okay. And, finally, two  
2 more categories. Both of these categories will be new  
3 categories for this Work Plan.

4           "Food Packaging" we proposed including because we  
5 received an awful lot of stakeholder recommendations and  
6 requests to include that, and, in fact, in 2016, we received  
7 a petition asking us to address bisphenol A in food cans,  
8 and, while we were unable to grant the petition, in looking  
9 at issues related to food packaging, we became aware of  
10 potential exposures to a number of chemicals from food  
11 packaging, and so we thought it would be a good area for us  
12 to look at, and there also recently has been talk of legal  
13 action to address perfluoroalkyl substances in food  
14 packaging. So we think this is an appropriate category for  
15 the food -- for the food -- for the Work Plan.

16           "Lead-Acid Batteries" is the last category I want  
17 to mention. This is a special category. This category was  
18 actually added to our Work Plan by act of our legislature,  
19 and it was actually added to our last Work Plan, and, in  
20 fact, we began working on it last year. There's been a  
21 considerable amount of work done, and we had a  
22 stakeholder -- or a public workshop -- this last year as  
23 well, and so we haven't finished that work yet. We want to  
24 continue on with it, and, therefore, we are going to include  
25 it in the new Work Plan. Okay.

1           So the next slide just gives a brief summary,  
2 "Beauty, Personal Care, and Hygiene Products," and the  
3 "Cleaning Products" category are not shown, because, again,  
4 we're not changing the names from the old Work Plan, and we  
5 don't believe that we're changing the scope, even though  
6 we've revised the category descriptions a little bit. So  
7 all I'm showing here are those that are going to change, and  
8 how.

9           The first three here, this is the -- in the center  
10 column, it shows the name in the old Work Plan, shows how  
11 we're proposing changing the name, and, in fact, the product  
12 description and name changes would indeed change the scope  
13 of the category, and then I just in "Food Packaging" and  
14 "Lead-Acid Batteries" because those are completely new  
15 categories.

16           Okay. So, in closing, I have a couple more  
17 slides. Okay. We are really looking forward to beginning a  
18 dialog with you, and the public as well. We are really  
19 hopeful that we're going to get a lot of good input from our  
20 public comment period that's open right now. We have  
21 specific questions that we are going to propose to you, and  
22 I'm going to put those up on the board in just a minute, and  
23 we're eager for your feedback.

24           In terms of engaging the public, as I mentioned,  
25 we have this comment period running through March 9th. It's

1 currently open on our CalSAFER web site. We also are  
2 planning a workshop here in this building, in the Sierra  
3 Hearing Room, on February 26. More information on both of  
4 those topics can be found at this link that I've given here.

5           Then I just wanted to also say that, as we move  
6 forward implementing this plan, we learned much in  
7 implementing our last plan. We have moved forward quite a  
8 bit, and we relied on many of the lessons that we learned in  
9 creating this work plan, and we hope to continue to apply  
10 those lessons that we've learned as we move forward in  
11 adopting and implementing this Work Plan.

12           One more slide before I get to the questions.  
13 Here's my contact information, in case anybody wants to  
14 contact me with any questions. You can also find me on  
15 DTSC's public web site, under the staff directory. I'll  
16 leave that up for just a second so, if anybody wants to copy  
17 any of the information, they can. Okay.

18           Then, finally, here are the questions that we  
19 propose for you, the Science Panel. We would like to  
20 know -- we are especially interested, actually, in receiving  
21 feedback on our product category descriptions, and whether  
22 or not we've gone a good job in revising them. So we're  
23 interested in whether or not the product categories are  
24 clearly and sufficient defined and aligned with our stated  
25 policy objectives.

1           We would like to know what priorities, including  
2 specific hazard endpoints, chemicals, and so forth we should  
3 pursue. We want to know what you think about any  
4 anticipated challenges we might face in identifying the  
5 specific products within the categories we've identified.

6           We would like to know if you anticipate any data  
7 gaps that we might encounter, or anticipate any information  
8 needs associated with the product categories, and whether or  
9 not you have any recommendations for closing those data  
10 gaps, and then we would like to know if there are  
11 prioritization methodologies that we may not be aware of, or  
12 rubrics that we may apply to our implementation of the Work  
13 Plan. And that's it.

14           PANEL CO-CHAIR FONG: Thank you.

15           At this time, are there any clarifying questions  
16 for Rob on the presentation? Just as a reminder, this  
17 question-and-answer period, it's for asking questions  
18 related to the slides and the presentation. So, if there  
19 are, you know, questions that's more suited for panel  
20 discussion, it would be better to wait until then.

21           Questions for Rob? Yes, Elaine.

22           PANEL MEMBER COHEN-HUBAL: So just one quick  
23 question, and, again, me not knowing enough about the  
24 program, the two years, it's a two-year Work Plan? And is  
25 that part of the regs, that you have a two-year Work Plan?

1 MR. BRUSHIA: It's a three-year work plan.

2 PANEL MEMBER COHEN-HUBAL: Three-year Work Plan.

3 MR. BRUSHIA: This would go -- it would be 2018,  
4 2019, and 2020. It would end at the end of 2020.

5 PANEL MEMBER COHEN-HUBAL: Okay. And your year  
6 runs -- when does your year start? Does it start --

7 PANEL MEMBER SUTTON: You know, that wasn't  
8 specified in the regulations, and so the last one we issued  
9 in April. So our target is to get this one in place by  
10 April.

11 PANEL MEMBER COHEN-HUBAL: And then you'd have  
12 until April of 2020. So it's three years. Okay. Thanks.  
13 Can't do math.

14 PANEL CO-CHAIR FONG: It's Ann.

15 PANEL MEMBER BLAKE: So a clarification question.  
16 It's not listed in your policy priorities, which you've  
17 called "labor" and "worker exposure" in a couple of these.  
18 I'm just kind of wondering where that sits as a policy  
19 priority, or is that a question you'd like us to answer on  
20 the prioritization methodologies?

21 MR. BRUSHIA: Well, no. It's one of the -- in  
22 the regulations, it allows us to consider -- as we're  
23 prioritizing products and evaluating products, it allows us  
24 to look at sensitive subpopulations, and so they would fall  
25 within that category, and we are not meaning to imply that

1 we're not going to look at that. In fact, in some cases,  
2 that may be a primary area of concern, when we get into  
3 actually evaluating products. But we won't know that until  
4 we actually start doing the work, so it's something that we  
5 certainly would look at.

6 PANEL CO-CHAIR FONG: I have Jack, Ken, and then  
7 Mike. Jack.

8 PANEL MEMBER LINARD: I have a question about the  
9 old Work Plan. Is that now sunsetted, or, once this is  
10 approved, what happens to textiles and -- not going to work  
11 on it, or is there work that you 've started that you'll  
12 finish up?

13 MR. BRUSHIA: Do you want to answer it, Meredith?

14 DEPUTY DIRECTOR WILLIAMS: It's sunsetted, quite  
15 simply. We won't put any resources into those categories.

16 PANEL MEMBER LINARD: I just wanted to clarify  
17 that.

18 DEPUTY DIRECTOR WILLIAMS: Yes, and Rob did  
19 mention that, you know, it could be that we go back and put  
20 it in a future work plan, but that's not what we're --

21 PANEL MEMBER LINARD: Okay.

22 PANEL CO-CHAIR FONG: Thank you.  
23 Ken?

24 PANEL MEMBER GEISER: Bob, thank you for a fine  
25 presentation. I have a concern about one area, but I'm

1 going to prefigure it by asking a question, which is, on  
2 your building products and construction and renovation, in  
3 construction and renovation, does that include structural  
4 elements as well, meaning external paneling, beams, and  
5 concrete foundations, and stuff like that?

6 I mean, the words suggest construction materials  
7 or construction, but can you clarify what you think the  
8 agenda is going to be there? Thank you.

9 MR. BRUSHIA: I don't know that I can clarify the  
10 agenda, because we haven't done the work yet. I would say  
11 that anything that is used in the construction of a building  
12 that you might think of might be included. What we intend  
13 to focus on I can't say yet, because we haven't started  
14 implementing the Work Plan. We haven't done the work.

15 So, Meredith, did you have any additional -- or,  
16 Karl, did you have any additional --

17 BRANCH CHIEF PALMER: I was going to say that  
18 we're always keeping in mind the key criteria in the regs,  
19 which are "Is there exposure, and does that exposure have  
20 the potential for significant or widespread impact?"

21 So there's sort of a logical filter that we would  
22 put things through, so beams, that don't have as much  
23 potential for exposure as something as maybe a countertop or  
24 wallboard or other things, you know, are kind of probably be  
25 lower in the queue, but it really is driven by the

1 information we get, and then it's an inductive process. So,  
2 while everything is on the menu, so to speak, there's  
3 certainly things that would not be as high priority.

4 MR. BRUSHIA: The other thing is that our policy  
5 statements, one of the key ones was addressing chemicals in  
6 the indoor environment, and so we would be most interested  
7 in products that have that kind of an impact.

8 PANEL CO-CHAIR FONG: Mike.

9 PANEL MEMBER CARINGELLO: Rob, you stated one of  
10 your problems up front is, how do you cover all this in 10  
11 minutes, and you did a really good job with the presentation  
12 doing that. So thank you.

13 A question I have, and it's just because my memory  
14 is not always great, is I liked how you showed us the  
15 transition with the products, the categories. How  
16 significantly did the policies, the stated policies, change?  
17 And I know that they're still within the overall scope of  
18 the regulation, but there are certain pieces that you pick  
19 out in the Work Plan and say, "Here's what we're going to  
20 stress." How did those change between the two Work Plans?

21 MR. BRUSHIA: You know, that's a very good  
22 question, and I'm now actually kind of sorry I didn't make a  
23 slide comparing those. In the old Work Plan, we had six  
24 categories, first of all, and not just four, and I can't  
25 remember what they all -- policy priorities, I'm

1   sorry -- instead of just the four, and I can't recall what  
2   they all were, exactly.

3               DEPUTY DIRECTOR WILLIAMS:   So a couple things  
4   changed.  On the last set of policy priorities, they weren't  
5   actually all policy.  So, for instance, some of them were  
6   key data sources that we wanted to look at, like  
7   biomonitoring data.

8               So, number one, we really focused on what is  
9   policy, and then I'd say the other thing that changed was  
10  the way we described those policy priorities.  So, for  
11  instance, when we talk about children, we talk about hazard  
12  endpoints that are especially important for children in a  
13  way that we didn't do the last time around.

14              So, really, again, part of the intent of the Work  
15  Plan is to send some signals and to try to give people some  
16  light on how we're going to make our decisions, and so we're  
17  trying to flesh out, you know, what would be the natural  
18  things you would think about when we state a policy  
19  priority.

20              So we did drop workers as a policy priority, but,  
21  again, that's largely because it's so ingrained in the  
22  structure.  We didn't think that we needed particular policy  
23  statements around that.  The indoor air and the  
24  biomonitoring data were data sources, so we don't reference  
25  those anymore.  They're still important to us, given some of

1 the other things, but really tried to clean it up a little.

2 PANEL MEMBER CARINGELLO: Okay. Thank you.

3 PANEL CO-CHAIR FONG: Julie.

4 PANEL MEMBER SCHOENUNG: Thank you, Rob. Nice  
5 summary, as Ken said, of a long document. My question is,  
6 you explained why you modified the description of several of  
7 these categories, but you didn't really elaborate on why you  
8 dropped the two that you dropped. Are there lessons learned  
9 there, or particular reasons why those two categories were  
10 taken out, that give us a frame of reference for the ones  
11 that stayed?

12 MR. BRUSHIA: Indeed there are.

13 Karl, do you want to chime in on this one?

14 BRANCH CHIEF PALMER: Well, first let's talk about  
15 clothing. That's actually a really interesting category,  
16 and there's a lot of issues in the supply chains for  
17 clothing, but one of the challenges there, we found, was  
18 that those are incredibly complex supply chains, and a lot  
19 of our concerns actually, or at least the weight of them,  
20 might be more at the manufacturing of the textile than the  
21 actual garment, and the structure of our regulations is to  
22 focus on specific products.

23 So that would have made it pretty tricky, to  
24 figure out where that sweet spot might be of value, in terms  
25 of a huge investment of work to get to the right spot. So

1 it's not to say we won't look at it somewhere down the line,  
2 but it was a very broad category, and so we should have  
3 said, "Leave it off this time."

4 As far as fishing and angling equipment, that one,  
5 I think -- by the way, that was the category which we had  
6 the most input in, in the last Work Plan, and I'm sorry that  
7 the California Sports Fishing Alliance is not here today,  
8 but I think part of the reason -- that one was pretty  
9 straightforward. Our focus was on small lead weights that  
10 were used in fishing and angling that were ingested by  
11 waterfowl. We feel there's extremely strong data to show  
12 that that's a problem.

13 We also feel that there's extremely obvious  
14 alternatives out there that are on the market right now  
15 that, in some sense, our investment of going through the  
16 whole regulatory AA process probably wasn't worth it,  
17 because at least Karl Palmer's feeling is, you can go to  
18 Cabela's or Bass Pro Shops and find a good alternative  
19 today.

20 So that might be something for a different  
21 organization to look at in terms of encouraging the use of  
22 safer alternatives, as opposed to our valuable resources  
23 that have some bigger challenges. So it was sort of a  
24 no-brainer.

25 DEPUTY DIRECTOR WILLIAMS: I would say that, if we

1 had endless resources, we wouldn't have dropped it. Right?  
2 It was a very large stakeholder community, and in terms of  
3 incentivizing innovation and things like that, we weren't  
4 going to do that. I mean, our regulations weren't going to  
5 do that. But Karl and I are both avid birders --

6 BRANCH CHIEF PALMER: And anglers.

7 DEPUTY DIRECTOR WILLIAMS: -- and Rob is a sport  
8 fisherman, and we feel pretty passionately about that issue.

9 MR. BRUSHIA: And I do not use lead fishing  
10 weights. Let's confirm that out here.

11 PANEL CO-CHAIR FONG: Jack, do you have another  
12 question?

13 PANEL MEMBER LINARD: One more comment. On one of  
14 your first slides, you talked about stakeholders. Two of  
15 your categories aren't covered by your stakeholders, and  
16 that's obviously beauty and personal care and hygiene  
17 products, but also food-contact packaging. Those are FDA  
18 and USDA, and there are food-contact regulations.

19 I would just hope that you're planning on  
20 contacting both of those agencies and developing -- so that  
21 they get on the list, it's not just EPA. And then we  
22 mentioned yesterday the Consumer Product Safety Commission,  
23 which actually is responsible for the safety of all other  
24 products, not FDA.

25 MR. BRUSHIA: Indeed. We are actually are

1 compelled by our regulations to consider other statutory and  
2 regulatory frameworks, and we will indeed be doing that. We  
3 don't intend, in implementing our regulations, to cause any  
4 kind of conflict with other existing laws and regulations,  
5 and, in a way, we have started that process already. We  
6 will, in fact, actively engage those folks.

7           We have here at the state level our Department of  
8 Public Health, which actually manages some programs that  
9 regulate cosmetics, for example, and so we feel we've  
10 started along that process to engage them, and we will do  
11 so, and we will be mindful of their existing purview, and  
12 not create conflict with it.

13           PANEL CO-CHAIR FONG: Ann, we have plenty of time.

14           PANEL MEMBER BLAKE: Okay. I think, just to add  
15 to the clarification for that, the food contact piece is  
16 probably not the piece that DTSC is going to be as concerned  
17 about, but the impacts on water, particularly, because some  
18 of the packaging materials we're thinking about -- I'm  
19 thinking about PFAS, which everyone is talking about these  
20 days.

21           So I'm speaking on behalf of -- feel free to kick  
22 me at any time, but, in my read of the regulations, you're  
23 asked to look at other relevant regulations, but it's  
24 also -- wow. It's actually spread around the table. Maybe  
25 I should stop at this point, but DTSC will look at the piece

1 that's relevant for human health and environment in  
2 California, and that will be separate from existing federal  
3 regulations.

4 DEPUTY DIRECTOR WILLIAMS: Right. We have to  
5 figure out whether we can enhance protection.

6 PANEL MEMBER BLAKE: Thank you.

7 DEPUTY DIRECTOR WILLIAMS: And so that's the  
8 language, and we have to look at where we think there isn't  
9 enough happening. I would only say that we're not limiting  
10 ourselves to the aquatic impacts.

11 Obviously, the ingestion piece is important, but  
12 there are a lot of different -- we were petitioned to list  
13 FDA and food-can linings, and in evaluating that petition,  
14 we did not grant that petition, but we learned a lot about,  
15 you know, that space, and recognize that there are some  
16 opportunities for us to meaningfully enhance protections.

17 PANEL MEMBER BLAKE: Thank you for clarifying that  
18 even further.

19 DEPUTY DIRECTOR WILLIAMS: And I would just remind  
20 folks that there is that petition process, and so there's  
21 the potential for us to add categories or add individual  
22 products based on a petition.

23 PANEL MEMBER BLAKE: Can you talk a little bit  
24 more about the petition process and how it's been used so  
25 far?

1           DEPUTY DIRECTOR WILLIAMS: Well, it's only been  
2 used twice. One was pretty much not compatible with the  
3 regulation. Somebody asked to remove a chemical or a set of  
4 chemicals, and we weren't even allowed to do that in a  
5 certain time frame. So that one was not really -- from the  
6 candidate chemicals list.

7           So you can add or remove candidate chemicals or  
8 priority products by amending the Work Plan, and so there's  
9 a petition process where the petitioner is asked to -- it's  
10 a pretty high bar. The petitioner is essentially asked to  
11 make the case for the potential for exposure and the  
12 potential for adverse impact, and also to address things  
13 like data gaps, presence of alternatives, things like that.  
14 Basically, everything that we do in our technical document  
15 we're asking the petitioner to do, so it is a very heavy  
16 lift. Nevertheless, that's what the regs call for.

17           Did that answer your question?

18           PANEL MEMBER BLAKE: Uh-huh.

19           PANEL CO-CHAIR FONG: Rob, thank you very much for  
20 your excellent overview of the Work Plan development.

21           Before we get into a panel discussion -- I'm  
22 sorry, Mike.

23           PANEL MEMBER CARINGELLO: I just want to be clear  
24 before we get into the -- could we click back to the policy  
25 slide? Because, with what Ann was saying, I don't disagree,

1 but, in looking at the policy slide, I think that the policy  
2 for the food-contact materials talked about --

3 MR. BRUSHIA: There it goes.

4 PANEL MEMBER CARINGELLO: The next one, yes. Yes.  
5 The words "Striving to protect California from chemicals  
6 that migrate into food from food packaging," if that's part  
7 of the policy, then DTSC isn't saying, "Well, we're really  
8 concerned about the aquatic environment solely from this,"  
9 that they are indeed looking at the food as well?

10 DEPUTY DIRECTOR WILLIAMS: It's both. Right?

11 PANEL MEMBER CARINGELLO: Yes.

12 DEPUTY DIRECTOR WILLIAMS: California composts a  
13 lot, right? And so any chemicals that are problematic that  
14 are getting into the compost waste stream have the potential  
15 for aquatic impacts. Not only that, litter is a tremendous  
16 problem, and so chemicals are ending up in surface waters as  
17 a result of litter. So there are a lot of -- the exposure  
18 pathways are extensive.

19 BRANCH CHIEF PALMER: Can I just add one -- I just  
20 also want to add that three years can be a long time, and so  
21 these are just the priorities. It's not to say that  
22 something may (sic) come up in the interim that we didn't  
23 know about, that clearly should be a priority, and that we  
24 would take -- we're not taking anything off the menu here.  
25 We're just highlighting the ones that we're looking at

1 first.

2 PANEL CO-CHAIR FONG: Okay. Are there any more  
3 clarifying questions for Rob?

4 If not, again, thank you very much for just an  
5 excellent overview.

6 Before we get into the panel discussion on the  
7 Work Plan development, at this point on the agenda, I think  
8 we're to take public comments on today's agenda items.  
9 Marcus.

10 MR. SIMPSON: Thank you, Art, and also thank you,  
11 Rob, for a very informative presentation and discussion.

12 Before we transition to our public comment  
13 segment, I just want to issue a quick request, and encourage  
14 commenters to please limit comments to today's presentation  
15 and discussion. Thank you much.

16 For those on line, for our audience on line, just  
17 another reminder to please send comments to  
18 saferconsumerproducts@dtsc.ca.gov. If we receive comments  
19 from our on-line audience, we will read those comments  
20 following taking comments from the folks present here today  
21 in the room. Okay?

22 So, that said, do we have any public comments here  
23 in the room? Going once. All right. So, if anyone changes  
24 your mind in the next few minutes, my colleague, Diana  
25 Phelps, there in the rear of the room, she has comment

1 cards, as well as a microphone, if you'd like to stay to  
2 comment from your seat.

3 Okay. Art and Kelly, it doesn't look like we have  
4 any comments in the room.

5 Baoku, do we have any comments on line?

6 MR. HER: No.

7 MR. SIMPSON: All right. Thank you, folks. No  
8 comments in the room, Art. Thank you. All right.

9 PANEL CO-CHAIR FONG: Great. Excellent.

10 PANEL CO-CHAIR MORAN: Want me to take over?

11 PANEL CO-CHAIR FONG: Please.

12 PANEL CO-CHAIR MORAN: Okay. So, at this point,  
13 we'll start the panel discussion of the work plan. The  
14 staff have asked us five questions, if I can count right.  
15 Yes, that's five.

16 What I would -- although we have -- as we talked  
17 about yesterday, although we have quite an extensive period  
18 of time on the agenda, given the discussion yesterday, and  
19 interest in the research item, I'm thinking that we might  
20 want to wrap this discussion up more quickly, and give  
21 ourselves more time for research, but we will see how it  
22 goes.

23 So I'm going to suggest that we start with the  
24 first two questions: "Are the product categories clearly  
25 and sufficient defined and aligned?" and "What priorities,

1 including hazard endpoints, chemicals, chemical function, et  
2 cetera, should we pursue?" and go around once on that, and  
3 see if there's anything we need to discuss there, and then  
4 move to the next three questions that are more related to  
5 doing the research on identifying this potential specific  
6 product, chemical categories for regulation.

7 In the first part, if there's something important  
8 that isn't covered by one of these questions, I'd really  
9 appreciate it if panelists would please raise that at this  
10 time, and if there's anything you think that the group  
11 should be discussing, I want to raise that, too, at that  
12 time.

13 So our charge on reviewing the Work Plan --  
14 they've asked us these five specific questions, but the  
15 legislature has asked us, very broadly, to make  
16 recommendations to the department about chemicals and, I  
17 think implicitly, products that contain them that would be  
18 appropriate to regulate.

19 So, if we do have remarks on those things, I would  
20 encourage you to bring that stuff up. Now is the perfect  
21 time for that, because it is the public comment period, and  
22 if there's some scientific, solid basis for the department  
23 to be considering something else, now is the perfect time  
24 for them to be hearing about that from the panel. So these  
25 questions are a little narrower than that, and in the first

1 grouping, if there's something else that you think ought to  
2 be out there, I think is very much appropriate for the panel  
3 to do that, based on the legislation.

4           So, with that, I'm thinking of starting with Helen  
5 and working around that way, just to circle it in a new  
6 direction with the first two questions, and anything else  
7 you might want to add.

8           So is everybody good with that process?

9           PANEL CO-CHAIR FONG: Uh-huh.

10          PANEL CO-CHAIR MORAN: Okay. Helen, you're on.

11          MS. HOLDER: So, actually, my comment is not  
12 specific about the categories, but I just want to commend  
13 the department for articulating the values, as we've come  
14 back to many times, clarifying, and I think this language is  
15 much clearer and much easier to act upon. So I just wanted  
16 to just say that was very, very good.

17          PANEL MEMBER COHEN-HUBAL: So, echoing that point,  
18 I think, this time around, there's real clarity in sort of  
19 your objectives. I think you've selected product categories  
20 where there is a void in kind of -- you've picked areas  
21 where you can have an impact, where there are needs that are  
22 not necessarily met by other jurisdictions and other  
23 activities, at least in the public sector.

24          Then what I would say, too, though, is that you've  
25 also -- you've got a couple of the ones from the previous

1 Work Plan that's a little bit lower hanging fruit in terms  
2 of data and methods, and I think it's going to get -- I  
3 think you've picked some areas that part of why they haven't  
4 been as -- well, they haven't been clearly addressed in a  
5 lot of ways because, again, there's not sort of that  
6 regulatory mandate on the federal side, maybe, and it hasn't  
7 been, really, across many jurisdictions, right?

8           So, when you're picking articles, whether it be  
9 in the furniture or the -- what was the other category you  
10 have? You have a couple different ones in there -- building  
11 products and things like that -- there's a lot of interest  
12 and a lot of activity around those areas, but there's going  
13 to be a lot more data gaps, I'm pretty sure.

14           So I think this will be fascinating. I'm just,  
15 when you're implementing -- I mean, this is -- again, you  
16 haven't -- you mentioned that you were over-ambitious in how  
17 many products you would be able to put into the pipeline.  
18 This is no less ambitious, but it's much more clear, and  
19 articulated in a really tight, focused way. So I appreciate  
20 that.

21           PANEL CO-CHAIR MORAN: All right. Ken, on to you,  
22 particularly focused on the first couple questions, and  
23 anything broader you want to bring up.

24           PANEL MEMBER GEISER: Yes. Thank you. First of  
25 all, I think that the goals now, or the policy, goals,

1 objectives, are very doable and very cogent. I think that  
2 they were a little broad before, in the older -- in the  
3 original Work Plan, and now these look very -- they look  
4 like you've learned, and these are well honed in that sense,  
5 which I like.

6           Generally speaking, I agree with the way in which  
7 you've chosen specific product categories to look at. I  
8 think that mostly makes sense. I have some concerns,  
9 though, and one is the absence of the word "workers" in the  
10 (indiscernible). I understand what you are saying, that  
11 workers are so ubiquitous in all of this that they may be  
12 just implied, but implied is one thing, and not recognized  
13 is another.

14           I don't think it would be detrimental to the way  
15 the goals are written at the moment, but it just seems to me  
16 that that's an important thing that you've taken on, and  
17 particularly (indiscernible) home insulation, which is  
18 mostly a (indiscernible) kind of thing, and I'd hate to  
19 think that the assumption is that we're moving away from  
20 (indiscernible) about workers.

21           So I would encourage something having to do with  
22 the word "worker," or "occupational" or whatever. I know  
23 you don't want to cross over into the business of other  
24 agencies, but I (indiscernible) in the authority, and  
25 important particularly for workers.

1           The second area is the one that I prefigured  
2 already, and that is, I am concerned about building  
3 materials, particularly the structural elements of building  
4 materials. It's a big area, and there's a lot of  
5 controversy. Some of you may be aware of the healthy  
6 building materials credits that the Green Building Council  
7 has attempted to put into the LEED standard, and some of the  
8 politics of that, which has been difficult.

9           I think that it's useful to, if nothing else,  
10 connect up with folks at USGBC, and try to understand that,  
11 but I really think your objective is to stay with the idea  
12 of consumer products, and in my mind, the construction  
13 element in a building is not necessarily a consumer product.  
14 Wall surfacing, the carpets, the various elements in the  
15 building might well be something that impacts the indoor air  
16 quality.

17           So that's not my only reason. It's most that I  
18 just think the category is too big, and (indiscernible).  
19 Well, let me make that clearer. I find your interest in  
20 food packaging to be particularly useful. I think that's a  
21 very good one. It's an area that is becoming very ripe.  
22 There's a sort of an in-good currency to think about food  
23 packaging, and food packaging -- thank you. All right.  
24 Thank you.

25           PANEL MEMBER LINARD: My orders.

1           PANEL MEMBER GEISER:   Okay.   Thank you, Jack.

2           Food packaging.   I think that the way you've  
3   defined it, as dealing with only those elements that are  
4   maybe too narrowly focusing in on, the effect of migration  
5   into food, is too narrow.

6           I mean, you've got another goal here, which is to  
7   be concerned about water and water resources, and to the  
8   degree that food packaging is one of the kinds of pollutants  
9   that is showing up a lot in, certainly water, in surface  
10   waters, but also in the ocean, it seems to me that that's a  
11   "two-fer" that you can get out of looking at food packaging  
12   a bit more broadly than just in terms of its migration and  
13   effect on food itself.

14          There is also this growing -- you're probably  
15   aware of this growing NGO movement around the Pacific  
16   dealing with plastic pollution from land-based sources, and  
17   California is clearly one of the big players in that, and to  
18   the degree that food packaging is one of the things that's  
19   showing up a lot as one of those sources, it seems to me  
20   that speaking to that issue can be very useful here as well.

21          So I like the topic, but I think that one is a bit  
22   too narrowly drawn.   On the construction materials, I think  
23   it's too broadly drawn.   Thank you very much.

24          PANEL MEMBER COHEN-HUBAL:   May I ask a clarifying  
25   question?

1           PANEL CO-CHAIR MORAN:  No.  Why don't we go  
2 around.  Write yourself a note.  Thanks.

3           PANEL MEMBER LINARD:  I found it interesting that,  
4 in your assessment of the previous Work Plan, you  
5 specifically mentioned Colgate-Palmolive by name, which  
6 brings me to the question that, in terms of beauty and  
7 personal care, many of the chemicals that you have selected  
8 are actually approved drug products in the United States,  
9 benzophenone, triclosan, in this case for oral products  
10 specifically, and also titanium dioxide.

11           When you talk about -- I mean, we're looking at  
12 the product categories "clearly and sufficiently  
13 articulated."  Does that include drug products as well,  
14 which are regulated under FDA, but a completely different  
15 division than cosmetics, which are, strangely enough, the  
16 Center for Food Safety and Nutrition, whereas drugs are  
17 regulated by the Center for Drug Evaluation and Research,  
18 and are approved separately, and given actual approval by  
19 FDA?

20           DEPUTY DIRECTOR WILLIAMS:  So I'm going to answer  
21 that question, and by way of that answer, I'll speak a  
22 little bit Ken's concern about construction products, which  
23 is, there's a very clear definition of what a consumer  
24 product is in our regulations, and maybe that's something we  
25 should include in the Work Plan, just to make sure that

1 people are clear, and it says drugs are excluded, medical  
2 devices, dental devices, strict pesticides.

3           So there are some things that are very clearly  
4 outside the scope of the regulations. However, there are  
5 some things that are in the regulations. So, not that I'm  
6 saying we're going to do it, but structural elements of  
7 building products, those actually are consumer products per  
8 the California definition.

9           PANEL MEMBER LINARD: So, yes. I just think, make  
10 it a bit clearer, because a lot of the drug products are  
11 regulated primarily by FDA's Drug Group, but they're also  
12 regulated as cosmetics.

13           DEPUTY DIRECTOR WILLIAMS: Yes, and it's very --

14           PANEL MEMBER LINARD: Both regulations apply.

15           DEPUTY DIRECTOR WILLIAMS: It's a very messy  
16 landscape --

17           PANEL MEMBER LINARD: Yes, I know.

18           DEPUTY DIRECTOR WILLIAMS: -- to figure out what  
19 the claims are. I mean, a lot of it depends on what the  
20 claim are around the product.

21           PANEL MEMBER LINARD: I know. I manage our drug  
22 program. It is messy, but the bar for going from cosmetic  
23 to drug in the United States is incredibly low. Most of our  
24 over-the-counter drug products are actually cosmetics, and  
25 everywhere else in the world -- so I just again want to make

1     sure we clearly articulate what's covered and, by inference,  
2     what is not covered.

3             Then, just lastly, on the food contact, I know you  
4     answered that you're focusing as well on the aquatic  
5     toxicity of some of these, but 90 percent of what you've  
6     written in the document is on issues with packaging  
7     chemistry coming into food itself, and then the human health  
8     issues that that causes.

9             So, again, in terms of clarifying it, make sure  
10    it's not just a throwaway line at the end that you will look  
11    at the fate and effects of any of those chemicals. You  
12    know, make sure it's a little bit more prominent than it is  
13    now, because right now you talk pretty much only about food  
14    contact and impact on human health.

15            PANEL CO-CHAIR MORAN: Thanks, Jack.

16            Ann, focusing on the first couple questions and  
17    anything else you want to say.

18            PANEL MEMBER BLAKE: Thank you. And I guess I  
19    will try to stick to those questions, Kelly.

20            Are the product categories clearly and  
21    sufficiently defined? Yes, absolutely. Great work on that,  
22    and great work learning from your engagement with  
23    stakeholders to provide that clarification, and sticking  
24    within the regulations, which are quite wordy on this aspect  
25    of what you can cover.

1           I would say, also, great rationalization for  
2   drafting the two categories that you did, and I think that  
3   will help us when we move forward to the prioritization  
4   discussion. You went somewhere where you don't have an  
5   impact on the supply chain, because the key point of  
6   intervention is elsewhere, and then, also, you know, whether  
7   there are alternatives, and you did not need to really push  
8   for innovation. So I think those are things that we want to  
9   keep in mind when we talk about prioritization for the  
10  remaining product categories.

11           I would echo -- thank you, Ken. I would echo the  
12  concern about making an explicit mention for workers. I  
13  think that was the strength of the last -- a strength of the  
14  last Work Plan, and I would like to see that more explicit  
15  here. I really appreciate that you feel like it's  
16  integrated into all of these, and I see that in the  
17  descriptions of the product and chemical target areas, but I  
18  think making it explicit is something that DTSC can provide  
19  a specific value on, and it's a series of sensitive  
20  subpopulations that are frequently forgotten.

21           So I would echo that strongly, and I would also  
22  say -- and this also gets into our prioritization discussion  
23  a little later, which is, thank you also for taking on food  
24  packaging, as a result of the many petitions, for all the  
25  different potential multiple exposure pathways that you

1 mentioned and know well. I think we need to think a little  
2 more about what the value add is that DTSC can bring to that  
3 discussion, because there is a lot of activity around it,  
4 particularly around the PFAS chemistries, but I do feel like  
5 there is some value add there. So thank you for adding  
6 those two.

7           PANEL MEMBER SCHOENUNG: I want to make just a few  
8 comments on this. I want to agree that I like the ones that  
9 you've dropped, and the reasons you've chosen to take those  
10 off makes sense. So I appreciate that clarification. I  
11 also like that you've added lead-acid batteries. I'm glad  
12 to see that we took one lead out but we put another lead  
13 back in, because we still use lead in way too many things,  
14 and I'm just going to put a plug out there.

15           It doesn't, maybe, fit in the scheme of consumer  
16 and high-exposure potential, but solar panels are moving  
17 towards lead-based perovskite materials, and it would be  
18 nice if that was addressed at the design stage, as opposed  
19 to 20 years from now, when people are taking them back off  
20 their roofs, trying to figure out what to do with leaded  
21 material.

22           I'm going to put that out there as something to  
23 think about, if there's a way to preempt that in some way.  
24 That would be an interesting signal to send to the industry,  
25 to really think about that, because there are potential --

1    there may be potential alternatives to needing to use lead  
2    in those materials.  It's a trade-off of performance.

3               Yes.  Helen is shaking her head, going, "No, maybe  
4    not," but I think there needs to be effort put there,  
5    because there's a lot of investment right now on lead-based  
6    perovskite systems for solar panels.

7               I also just want to indicate that I'm glad to see  
8    the changes to put schools and offices in here, and the  
9    focus on the indoor environment, that it's not just homes.  
10   Most of us actually don't spend very much of our day, other  
11   than sleeping at home, but we spend a lot of time in offices  
12   and schools and other workplaces, other than  
13   manufacturing-type facilities, and specifically work  
14   environments is important, which links, to me, to the  
15   building materials.

16              I see kind of a fuzzy line, actually, between the  
17   building materials category and the home furnishings and  
18   décor category.  Where does carpet land, for instance, in  
19   those two, if you're renovating?  Does that land in  
20   building, or does that land in "I'm choosing to redo my  
21   floor with carpet," and adhesive issues and so on?

22              So I imagine some of that may have come up in your  
23   conversations, but I think I would counter Ken's comment  
24   about the building materials, and maybe it is too big and  
25   too broad the way it's stated, but I wouldn't want to see it

1 taken out or narrowed down too much, because I do think  
2 there is this push from the Green Building Council, and work  
3 through the Healthy Building Network, and Tom Lent and their  
4 folks, and the Data Commons, to really push, and my little  
5 interaction with them is that that community is actually  
6 engaging in this discussion, you know, everywhere from the  
7 architects through the contractors.

8           So I think there is some ability to get some  
9 resonance with that community, where they're going to go,  
10 "Okay. Yes. Fine. Just tell us what to do, and we'll  
11 figure out how to do it," as opposed to some other  
12 industries, where they just keep going, "No. We're okay.  
13 No, we can't do that." So at least there's, you know, some  
14 engagement there.

15           I imagine, Karl, that you might already know, at  
16 UC Davis, there is a faculty member in public health, Debbie  
17 Bennett, who has been doing a lot of work on the indoor  
18 environment and the exposure potentials there. So those are  
19 my comments.

20           PANEL MEMBER SUTTON: I'd like to thank the group,  
21 the presentation this morning, and also the background  
22 document, because I learned a lot from your lessons learned,  
23 and it helped me read the Work Plan and see it as so much  
24 comprehensive and cohesive in the way everything fits  
25 together, compared to the previous plan, stuff I didn't even

1 identify. Based on your lessons learned, I now see that  
2 this is a really cohesive and even more useful document  
3 compared to the previous one.

4           So I do think the categories are clearly and  
5 sufficiently defined. I liked the way they're laid out. I  
6 particularly liked mentioning auto products when it came to  
7 cleaning products, and part of that is because, if you're  
8 using a product on your car, its pathway to the environment  
9 might be different. It might not be going down the drain  
10 into a treatment facility, where it's going to get a bit of  
11 degradation. It might be going right to your storm water.  
12 And so that different pathway might create different  
13 concerns out in the environment.

14           In the Bay Area, we've seen some evidence, some  
15 preliminary evidence, from monitoring showing, for example,  
16 monophenolic oxalates can be present at significant levels  
17 in areas influenced by storm water, rather than our  
18 wastewater. You know, it's a different pathway, and  
19 possibly the thought is that that could be due to some car  
20 products, so, you know, some preliminary evidence there.

21           Then I guess I'm more on Julie's side and less on  
22 Ken's side in terms of the building products category. I  
23 really liked the big category. You're not necessarily going  
24 to choose a priority product, you know, that encompasses the  
25 breadth of that category, but, again, thinking about the

1 environment, thinking not just indoors but outdoors, as we  
2 see all this construction in our communities, our growing  
3 population, I'm thinking about how this stuff is getting out  
4 into our urban environment and our waterways. So, for me, I  
5 like the breadth of the category.

6           One category I saw that fits well with some of  
7 these, some of the goals that wasn't mentioned, was  
8 electronics, and not that I'm trying to wedge that in here,  
9 obviously, but I imagine that the complexity of the supply  
10 chain that you guys mentioned with clothing could be a big  
11 issue in the electronics category.

12           In terms of data gaps, one of the -- obviously,  
13 the problem you're going to --

14           PANEL CO-CHAIR MORAN: We're just doing the first  
15 two questions right now.

16           PANEL MEMBER SUTTON: First two?

17           PANEL CO-CHAIR MORAN: Yes.

18           PANEL MEMBER SUTTON: All right. Get to that  
19 later. I think that's it.

20           PANEL MEMBER CARINGELLO: I'm not sure what more  
21 I'm really going to add, but I'm going to try, anyway. You  
22 know, the first question, I absolutely think the way it's  
23 written this time around, and after what Rob said, that yes,  
24 the product categories are clearly and sufficiently defined,  
25 and they very, very closely match with the stated policy

1 objectives.

2           What I would say -- and I guess I'm more aligned  
3 with Ken on this -- is that some of the categories are very  
4 broad, and I think there is application for having very  
5 broad categories, but I think we've got -- in this case,  
6 we've got some very broad categories and we've got some  
7 narrow categories. So there is kind of, which direction do  
8 we choose to take? You know, you've got the lead-acid  
9 battery. It's kind of "Okay. Here's a pretty narrow  
10 category," and so you've got different stakeholders looking  
11 at it in different fashions, you know.

12           So, while the broad category gives you a much  
13 wider net to tackle going forward, and making choices, and a  
14 lot more leeway, it does then make it harder for  
15 stakeholders, up front, to engage you. Say, with the  
16 fishing tackle people, they knew right away what you were  
17 after, and you got a lot of information very, very rapidly,  
18 maybe more rapidly than you wanted, you know.

19           So what I'm not seeing, I guess, is the balance,  
20 maybe, that you've left some very broad and some narrow, and  
21 maybe that's intentional, but I kind of think, like Ken,  
22 what you're not giving, then, is for the stakeholders to  
23 jump in earlier, to say, "I either with you here" or "I  
24 disagree with you," because some of the categories are so  
25 broad that people just aren't going to know what the real

1 aim is, but I think, if they delve into the document,  
2 they're get a lot of hints as to direction, but it's just a  
3 general comment, is I think the categories do kind of vary.

4           Also, with the policies, I think they're very well  
5 written. I think they're very clear. But, much like people  
6 were talking about with workers being missing, this time it  
7 looks like the focus is on children, and, while children  
8 might incorporate pregnant women, say, it might incorporate  
9 infants, they're not being specifically mentioned. I don't  
10 have an issue with it, but is there a message that people  
11 are going to take from these other sensitive subpopulations,  
12 like the elderly, are not mentioned this time around?

13           This being a three-year plan, it's right to say,  
14 "We can only tackle so much in three years, and this is what  
15 these products -- what we're going to tailor to for these  
16 three years," but I think maybe, then, in the Work Plan  
17 itself, then, a mention of the over-arching policy with the  
18 regulation, if that is embedded in at the beginning, saying,  
19 "Okay. Reminder. Here's what the regulation is. It covers  
20 all these things. Here's what we're tackling in this  
21 three-year plan.

22           PANEL CO-CHAIR FONG: Thank you, Kelly. So, in  
23 terms of the first question about "Is it clearly and  
24 sufficiently defined," I thought you guys just did an  
25 excellent job, I would say, but follow your thinking (sic)

1 as I was reading through the document. So I really  
2 appreciate that. So thank you very much.

3 As I was reading through, you know, the Work Plan,  
4 I think one thing that really I noticed was that DTSC tried  
5 to maximize its impact by minimizing overlap with the  
6 regulations, at least complementing the regulations. So  
7 that also really came through for me. So, excellent job.  
8 Thank you.

9 So the second point I want to make is related to  
10 workers, and totally agree with Ken and Mike about not  
11 seeing it in the document itself. So, when I was thinking  
12 about it, I thought, is it a situation where DTSC just  
13 didn't have the expertise, or didn't have somebody that was  
14 really passionate about worker and worker exposure that was  
15 pushing that point during the conversation, during your  
16 discussion? Because I previously remember, in the previous  
17 panel, Julia Quinn (phonetic) would always push the point  
18 about workplace and worker exposures, and I was thinking, is  
19 that the case within DTSC, that there isn't someone that's  
20 passionate or would have expertise on this particular topic,  
21 such that they're not pushing that point during your  
22 internal discussions? So that's another thing I thought of.

23 In terms of the second question about specific  
24 hazard endpoints, I notice nobody touched that, so I'm going  
25 to, and so I want to make a suggestion about perhaps

1 elevating focus on endocrine-disrupting chemicals, EDCs, and  
2 the reason for that is because there's a lot of concern  
3 about, you know, exposure and potential hazard related to  
4 EDCs, but the regulation is just not really a driver in  
5 terms of finding alternatives or safer replacements right  
6 now.

7           That's definitely demonstrated in what's going on  
8 in the EU in terms of, the European Parliament just sent  
9 back the EDC criteria, you know, sort of starting over in  
10 terms of just coming up with a definition, or working  
11 definition. So I think that's another place where, you  
12 know, if you're talking about specific hazard endpoints,  
13 where you guys can have a really major impact. Thank you,  
14 Cher (phonetic).

15           PANEL CO-CHAIR MORAN: Thank you, Art. So I've  
16 just got a couple brief comments, and then I'll make sure to  
17 go to Elaine for her question, and anybody else for any  
18 follow-up that we have before we move on to the next set of  
19 questions, where maybe we'll start with Becky, since she  
20 started on them, anyway.

21           So, in terms of the questions, I agree with the  
22 other panelists. I think the categories are clear and  
23 sufficiently defined and well based. I do want to  
24 compliment the department on the layout of the policy  
25 priorities, and join others in saying that I think,

1 particularly in light of our discussion yesterday, where we  
2 were talking about decision making, and being able to use  
3 policy priorities of the state as well as policy priorities  
4 of the individual organization that's doing the AA, that  
5 articulation is very important, and that's something to  
6 think about.

7 I think that's why you're hearing about workers,  
8 and perhaps, in the document, you've laid out the policy  
9 priorities for the Work Plan for the next few years. There  
10 are also some policy and decision-making priorities that are  
11 laid out in the regulations, and somehow pulling that  
12 forward might end up being a way of addressing that, if you  
13 don't choose to add workers or some other thing explicitly  
14 as a policy priority, and, of course, that's a policy thing,  
15 so that is up to the agency.

16 In terms of the priorities and endpoints, my  
17 comment here is more of a lament. I see the water policy  
18 priority, and I see some linkages in various places to  
19 water, but I feel that our monitoring programs are not at  
20 this point providing the robust data that we need to both  
21 understand where chemicals are coming from.

22 So we have a lot of monitoring data for very  
23 traditional pollutants, and we have specific problems, and  
24 we've been working on them, copper in brake pads, or sort of  
25 going out on zinc and so forth, but there's a lot of

1 emergent contaminants out there for which we don't have the  
2 kind of robust data sets, because our water-monitoring  
3 programs are not generating them for these other pollutants,  
4 and we also lack linkage information. So, where we know  
5 there's things present in aquatic biota and aquatic  
6 ecosystems, we aren't generating the data to help us link  
7 those back to the individual products.

8           I've seen all kinds of really intriguing stuff  
9 about runoff from buildings carrying various chemicals  
10 through urban runoff straight, untreated, into creeks and  
11 down and an ecosystem, but the chemicals that are measured  
12 there aren't being measured out in the aquatic environment.  
13 We're not doing that mix. We don't have anyone funded to go  
14 back and say, "Okay. Now, we found this thing in the  
15 aquatic environment. Let's try to apportion out what those  
16 sources are, and get the wash-off studies and other data  
17 that are needed to get there."

18           I'm particularly interested in outdoor building  
19 products in this area, but I don't think they're ripe  
20 for -- because we don't have the data to do that, at this  
21 point, I don't think they're ripe for coming up with a  
22 priority product, because the data aren't there, but outdoor  
23 building products, there's a lot of different intriguing  
24 data sets on leaching from paint and leaching from roofing  
25 materials, in particular, and the runoff flows directly on

1 impervious surfaces, so it doesn't soak into soil in many  
2 locations. It just runs straight into the water body.

3           So there's really direct, fast connective pathway  
4 from that runoff, and I think that's something that hasn't  
5 been thought a lot about in manufacture, but we don't have  
6 the data sets to support that now. That's also important  
7 because runoff supplies are starting to be used as sources  
8 of human drinking water, and that's going to be increasing.  
9 We look like we're turning into another drought, so that's  
10 going to continue to increase, and, again, so then we have  
11 questions not just about aquatic safety, but also about  
12 human safety.

13           So I've actually received phone calls. Every  
14 month or so now, I get a phone call saying, "Kelly, what's  
15 in outdoor building products, and are they going to make --  
16 you know, are we worried that our drinking water isn't going  
17 to be safe when we go for potable use of our runoff?"

18           So those questions are out there, and we need the  
19 science first, so I'm putting that out there as a lament and  
20 a challenge to our state to try to figure out how to fund  
21 the work that's necessary to understand that, and, of  
22 course, a challenge to the building community to identify  
23 that there is this runoff that's very direct to ecosystems,  
24 potentially, and I think we're going to soon be drinking  
25 this water, that we really need to think about the safety

1 for the ecosystems and for humans of all of the ingredients  
2 in outdoor building products.

3 So that was a little longer than, perhaps, it  
4 should have been, but overall very supportive. I want to go  
5 to Elaine, who's been extremely patient with her question --  
6 thank you -- and then anyone else who has anything they want  
7 to add on.

8 PANEL MEMBER COHEN-HUBAL: No, that's fine. I  
9 already had my turn. So I'm just curious because, on  
10 workers as -- well, no. It's actually a question to the  
11 panel, because at least three of you, four, maybe, called  
12 out that workers were not in the sort of priority policies  
13 for this round, and what I'm wondering is what the major  
14 concern is.

15 So Mark used a term yesterday that I really like,  
16 and I guess I haven't heard used often enough, but he talked  
17 about point of views, and so what I'm wondering is if the  
18 workers that you're specifically interested in calling out  
19 in the agency's policies at this point, in this context, are  
20 really more those workers at point of product use, rather  
21 than sort of workers more generally. Right? Because I  
22 think that's -- I think, for the agency and DTSC to have an  
23 impact on the product even sort of landscape, I felt like  
24 their policies were helping really do some -- I mean,  
25 somebody said three years is a long time. Three years is a

1 very, very short time.

2           So it's all relative, right, in terms of what  
3 you're trying to accomplish and how ambitious you're being,  
4 so I felt like it's very nice to have a focus. Mike said,  
5 you know, "Just clarify that these other vulnerable groups  
6 are still important," but I'm wondering if any of you who  
7 were concerned could talk about whether this "point of use"  
8 language is helpful.

9           PANEL CO-CHAIR MORAN: I'll do that, but I do want  
10 to offer Meredith -- I'm sorry, I missed you -- an  
11 opportunity if you want to say anything first, and then we  
12 can -- I think this is a good discussion topic. Yes.

13           DEPUTY DIRECTOR WILLIAMS: Yes, it's a great  
14 discussion topic. I just wanted to follow up on a few  
15 things that just came up throughout the conversation. We  
16 appreciate all the input about workers, and I'm interested  
17 in hearing even more about that.

18           The monitoring programs, I would turn around and  
19 ask, and this is an ongoing conversation. I'm going to  
20 throw it to you, you're going to throw it to me, I'm going  
21 to throw it to you, but where is the point of influence  
22 where Safer Consumer Products can shape monitoring programs  
23 around the state? That's a real challenge for us.

24           I wanted to talk about this messiness between the  
25 building products and the furnishings, and a great example

1 of that is rugs and carpets. Rugs are furnishings, and  
2 carpets are building products. So we recognize that, and  
3 we'll do our best to navigate that.

4 Then the last thing, about the building products  
5 and the large -- we feel as though there is a tremendous  
6 amount of activity in that space that we can leverage. So  
7 you said they may tell us, "Tell us what to do," but I think  
8 that what we have the opportunity to do is say, "Tell us  
9 what's been done."

10 You know, these huge real estate organizations,  
11 Kaiser Permanente, Google, Facebook, have taken some pretty  
12 aggressive steps around toxics in their work environments,  
13 and they have found ways to eliminate certain toxic  
14 chemicals in products, and there's an opportunity for us to  
15 level the playing field, and I really want us to be able to  
16 take advantage of that. So I just wanted to throw that out  
17 there.

18 PANEL CO-CHAIR MORAN: Okay. So potential  
19 reactions to that, and anything else, and I know, Elaine's  
20 question, I'd really like to hear some responses to that,  
21 and we've got Ann and Ken.

22 PANEL MEMBER BLAKE: Thank you, Elaine, for  
23 putting some words around that. I think I wouldn't want to  
24 exclude manufacturing workers in any of these applications,  
25 but you're absolutely right. The main concern of exposure,

1 and the ones that tend to be forgotten, are the "low barrier  
2 to entry" jobs that have high chemical exposure, tend to be  
3 immigrant populations, vulnerable because of past toxic  
4 exposures, in many cases women of reproductive age, but also  
5 not excluding men.

6           So yes, I think that's very helpful, and, also,  
7 very often the products that are used are considered safe  
8 for a much shorter exposure, and have been tested for that.  
9 So nail salon products is one. Clean products is another  
10 one that comes up a lot, you know, when you formulate it to  
11 be safe for a certain exposure, and then you don't calculate  
12 in a potentially much longer exposure. Nail salon workers  
13 don't work, you know, five days a week, eight-hour days, and  
14 those products were not designed to keep them safe.

15           So, on particular hazard endpoints, I just wanted  
16 to add, also, that if we look at particularly vulnerable  
17 worker populations, some of the hazard endpoints will emerge  
18 as we dig deeper into these product categories and product  
19 exposures of concern. Nail salon products will be  
20 reproductive hazards, hormone-disrupting chemicals. So,  
21 just a way of pointing that forward without really, you  
22 know, saying right now which hazard endpoints we should go  
23 after.

24           PANEL CO-CHAIR MORAN: Ken.

25           PANEL MEMBER GEISER: Well, thank you, Elaine, for

1 your question, and I'll try to -- my interest has about four  
2 different lines to it.

3 PANEL CO-CHAIR MORAN: Ken, can you grab the mike  
4 a little closer?

5 PANEL MEMBER GEISER: Sorry. Sorry. Sorry.  
6 Sorry. Sorry. I'll work on it.

7 UNIDENTIFIED SPEAKER: (Indiscernible.)

8 UNIDENTIFIED SPEAKER: That may be true. I had  
9 trouble hearing you.

10 There was first the issue of just not seeing  
11 workers here.

12 UNIDENTIFIED SPEAKER: (Indiscernible.)

13 UNIDENTIFIED SPEAKER: Try that one.

14 PANEL MEMBER GEISER: Try that one? Hello?  
15 Hello? Testing, testing. Okay.

16 UNIDENTIFIED SPEAKER: (Indiscernible) on the  
17 transcript.

18 PANEL MEMBER GEISER: The first level is just not  
19 seeing workers here, and recognizing the importance of  
20 acknowledging workers. That was one piece of it.

21 The second piece is, every product means workers.  
22 I mean, somebody makes products, and so workers are always  
23 implicated in any of the -- and any analysis means that  
24 you're going to want to take a look at what the exposures to  
25 workers are.

1           A third level is, some of these products that we  
2   may be considering, particularly like office products or  
3   school products or things like that, we're talking about,  
4   certainly, workers are point of views as well, in that  
5   sense.

6           The fourth level of that is, because I think it's  
7   always important that we're thinking about the life cycle of  
8   any product that DTSC takes up, then it's workers all along  
9   the supply chain, and workers all along the disposal  
10  trajectory. So it just seemed to me that workers are so --  
11  I mean, Meredith said it well. Workers are sort of  
12  integrated into everything, but it seems to me they  
13  shouldn't be lost.

14          Having said that, then I went back and took a  
15  look. Where would you introduce the word "worker" in this?  
16  And it's a little complex how to think about that. I think  
17  I'm really urging it, but I haven't a good solution at the  
18  moment how to do it. Thank you.

19          PANEL CO-CHAIR MORAN: Okay. Other comments on  
20  the worker thing, or anything else that anyone wants to  
21  raise before we move on? Jack?

22          PANEL MEMBER LINARD: Yes. I remember way back,  
23  when the Green Chemistry Initiative was passed, there was  
24  questions about "Does DTSC have authority over worker  
25  safety?" And I think we came to a healthy resolution, and I

1 don't know if it was formalized or not, but Cal/OSHA does  
2 have responsibility.

3 I think my recommendation is that you keep it on  
4 the radar, and then pick out certain areas where, for  
5 whatever reason, there are some deficiencies in the worker  
6 safety program, and I think you've talked about nail salons  
7 and things like that as maybe one of those areas where you  
8 need to put some focus. Because Cal/OSHA does have  
9 responsibility on the manufacturing side, that doesn't mean  
10 you neglect it and forget about it.

11 So I like the idea that -- Elaine said, "Point of  
12 use." I think that's one area where maybe OSHA doesn't get  
13 as involved, and, therefore, it might be appropriate for you  
14 to get more involved, but I don't think you should just say,  
15 "We're not going to do it." I think you have to keep an eye  
16 on it from the entire manufacturing, and I like the idea of  
17 end-of-use requirements as well, because throwing away  
18 products can be kind of toxic as well.

19 PANEL CO-CHAIR MORAN: Karl.

20 BRANCH CHIEF PALMER: Thank you. I just wanted to  
21 point out that, in the Work Plan, we tried to address what  
22 we called some "other factors." On page six and seven, we  
23 have a little paragraph in there, and we address workers,  
24 and we also address things like products where there's  
25 potential for a long-term, more repeated exposure, and we

1 also, importantly, I think, look at categories that may  
2 disproportionately affect people who live and work in  
3 environment justice communities, and these are all factors  
4 that are going to be highly dependent on the specifics of  
5 that category.

6           So I just wanted to call that out, and I think  
7 what I'm hoping to do is call out to those people listening  
8 here, and the experts in these categories, like, so, for, in  
9 building, USGBC and Health Building Network, to give us  
10 input on this Work Plan that will help us frame these  
11 categories, and maybe give us more information to take into  
12 consideration these factors you all have raised. So, thank  
13 you.

14           PANEL CO-CHAIR MORAN: Thanks, Karl.

15           So it looks like we're ready to move on to the  
16 second group of questions, so that's the last three,  
17 anticipated challenges in identifying specific products,  
18 anticipated data gaps and information needs, recommendations  
19 for doing that, and recommendations for prioritization  
20 methodologies and rubrics.

21           We'll start with Becky and go backwards this time.

22           PANEL MEMBER SUTTON: Regarding challenges in data  
23 gaps, obviously, one of the first one will be what's in  
24 products, and then the other data gap I'm thinking of is  
25 actually something Kelly just brought up, the pathways to

1 the environment, linking the linkage between the product and  
2 its presence in the environment.

3 So, in terms of what's in products, for some of  
4 these categories, we have some public or private databases,  
5 and, of course, I want to call out the Department of Public  
6 Health's own database on Prop 65 chemicals in cosmetics as  
7 an important resource, which I'm sure you guys already know,  
8 but maintaining that database is an important way to  
9 leverage state resources across multiple, you know, agencies  
10 or focus areas.

11 California also last year passed the Cleaning  
12 Products Right to Know Act, so that should mean that we have  
13 even more important on cleaning product ingredients and in a  
14 broader range of products.

15 That said, something I brought up yesterday, you  
16 know, your ingredients in your product is not always what  
17 you might be exposed to when you use it, and the one case  
18 I'm thinking of is powdered cleansers with chlorinated  
19 antibacterials where, when you're using it, you add water.  
20 There's some reactions, and you are off-gassing a complex  
21 range of volatile organics that are not necessarily  
22 considered ingredients in that product.

23 Then I'm thinking of pathways to the environment.  
24 Kelly kind of drew this all out, and to address that data  
25 gap is going to be tricky. I mean, a lot of times, the

1 studies aren't going to be there. You can start to look at  
2 data in the literature, in terms of storm water or  
3 wastewater testing, monitoring in environments where one or  
4 the other of these pathways is very dominant, but it's  
5 tricky, and, you know, I help out a monitoring program, so,  
6 obviously, there are some pathways where we can discuss  
7 leveraging opportunities to create some of this data,  
8 hopefully.

9 I also want to call attention to DTSC's  
10 nontargeted analysis products and efforts, because that  
11 could also be another way to build some of this information  
12 in the environment. There's already a lot of great work  
13 there, and if we can again support that effort, and leverage  
14 those skill sets and abilities, which are pretty new and  
15 complex, then we can all benefit.

16 PANEL MEMBER SCHOENUNG: I'm going to pass,  
17 because I don't have any specific comments on these  
18 questions at this time.

19 PANEL MEMBER BLAKE: Let's see. I'm actually  
20 going to pass on the "challenges and data gaps" question,  
21 because I know that that will probably be addressed. What  
22 I'd like to do is start us a little bit on the  
23 prioritization, so I started to think about, how would you  
24 go about prioritizing? Even though you've narrowed this  
25 down, this is obviously still a vast scope of products.

1           So I was thinking about several things to think  
2 about, and you mentioned a couple of them in your discussion  
3 of why you dropped a couple of categories. One is thinking  
4 about, what is the unique impact of DTSC in the application  
5 of chemical and product combination, or, you know, the  
6 broader impacts of that selection of that class of chemicals  
7 or class of products? And I don't know, necessarily, what  
8 that is, but I think you have a fairly good idea of what  
9 that might be.

10           This is one you could sort of take or leave, is  
11 whether -- and I think it's related to the value add, is  
12 leveraging current work. I can't believe I just used the  
13 word "leveraging," but here we go. So I'm going work (sic),  
14 for example, of PFAS and water contamination, and the  
15 various different sources of that.

16           One that, Meredith, you hinted at in the fishing  
17 angling piece that, in that category, you didn't feel like  
18 safer alternatives innovation needed to be driven, so  
19 another value add for DTSC is, where can you highlight that  
20 safer alternatives are needed, or, if there are some out  
21 there, what are the better ones? You know, what's the  
22 functionality, the function, at least, that we're after, and  
23 the performance that is not currently being met? Can we  
24 meet it without toxicity to human health with the  
25 environment?

1           Then I'm going to float this one out there, and  
2 again see if this works or not. One of the things that  
3 several colleagues of mine and I have been thinking about  
4 for years is, can we identify a chemical and material class  
5 that crosses industrial sectors, that, if you start to solve  
6 the problem in one functional area, with a different  
7 chemistry, can you translate that? So that's a potential  
8 ripple effect that DTSC could initiate, and we have some  
9 suggestions for what those might be.

10           In terms of data gaps, I think there is a function  
11 that you can serve by highlighting data gaps as well, as  
12 we've been starting to talk about around this table, is like  
13 where we would like to focus on this product in chemical  
14 combination, "Here are the gaps we're missing." Ones that  
15 Kelly and Becky have already brought up is, what are the  
16 linkages between environmental contamination and the  
17 products that they come from?

18           PANEL CO-CHAIR MORAN: All right. Jack, you're  
19 up.

20           PANEL MEMBER LINARD: Try this mic. Anticipated  
21 challenges in identifying specific products within the  
22 categories, I think you just have to try to understand which  
23 of those products would have the greatest impact on the  
24 population, you know, use. There's no sense in going after  
25 a product that just doesn't have the sales volume. You need

1 to prioritize and figure out, what are the big products that  
2 are out there? And I think there are ways to get that  
3 information, sales data.

4 Certainly, in a number of the categories, the  
5 formulations are known, because you put them on the label or  
6 on a web site. That's pretty simple. And this gets into  
7 the next discussion after this, but there's an awful lot of  
8 knowledge about prioritization. I always fall back on  
9 Health Canada. They've prioritized every chemical in  
10 commerce, a few years ago, into high, medium, and low, and  
11 then did risk assessment, exposure assessments for all  
12 those, and much of that is public.

13 So you can look at that. Health Canada did a  
14 marvelous job in the chemical management plan regulation, so  
15 that, but also there's a ton of data out there from, in my  
16 industry, the Cosmetic Ingredient Review. SECS in Europe  
17 has done a lot of evaluations of safety of chemicals in  
18 cosmetics and personal care products, and you've talked  
19 Region ECA (phonetic) already.

20 So I think there's a wealth of data out there.  
21 What you need to do is figure out which of these chemicals  
22 are used in the biggest tonnages, and then have obvious  
23 potential for the highest exposure in a consumer product.  
24 So, yes, I think the data is there. It's going to take some  
25 digging to find it.

1           Again, that's the same thing for closing data  
2 gaps. I would go to Health Canada because, again, they've  
3 done a phenomenal job of assessing what's out there and what  
4 needs to be done. So I think, really, there's a wealth of  
5 information, sometimes not easy, and then, don't forget, you  
6 can always ask a manufacturer. They may not be the most  
7 forthcoming, but you can ask, and sometimes you may do it  
8 under CBI, but it doesn't hurt to ask.

9           So I think, looking at that, the other thing  
10 which -- it's also interesting what's the role DTSC can  
11 play. I've mentioned it before. I deal with cosmetics,  
12 personal care products. This year is the 80th anniversary  
13 of the only regulation that we deal with, and that's the  
14 Food, Drug, and Cosmetic Act of 1938. It will have its 80th  
15 birthday on June 25th.

16           It is incredibly out of date, but the industry and  
17 I have also been working with Dianne Feinstein to come up  
18 with modernization, which would require FDA to actually do  
19 some safety assessments. So we're looking for improvements  
20 in this area from the federal side, too, so I think DTSC  
21 can, you know, recognize that that's going on.

22           We're looking for something more than what was  
23 offered 80 years ago. It's a real frustration by many of us  
24 to have to deal with such an antiquated regulation, but it's  
25 the reality. So we're working very hard to come up with

1 something that is palatable to everybody, and in our case,  
2 we want FDA to be much more -- to have a much bigger role in  
3 assessing prioritizing safety of cosmetic and personal care  
4 products.

5           PANEL MEMBER GEISER: Yes. My comments are a bit  
6 random here, but, first of all, yes, in terms of data  
7 itself, there's a lot of information out there on exposures  
8 in children, and a lot of good databases. The states have  
9 done good work on this. As you know, Washington State  
10 prioritizes this area in particular, and there's a lot of  
11 really great information there, and they do testing and all,  
12 and so that's a -- I'm sure, through your compact, but also  
13 your relations, you know those folks well, can -- is the  
14 thing still on the board, here?

15           On the construction materials, HBN and ferrous,  
16 and the various elements, the databases that they've  
17 developed certainly are useful and very helpful, but I think  
18 you're right, Meredith, there. They would be very helpful  
19 also in sort of helping to identify what would be a good  
20 area to be doing work on with regards to building products.

21           I've also found -- in just trying to do some of  
22 this work myself for the UN, I've found trade association  
23 data is useful as well, going and looking at various  
24 international trade associations that sometimes post data,  
25 particularly on amounts of products and things like this.

1           I talked to your staff person yesterday about the  
2 Mintel database, which I think is a very interesting-looking  
3 database on chemical constituents. It's only on specific  
4 categories, but I think it's a -- what I'm looking for is  
5 most of those, and in the next month, as I'm sort of focused  
6 on that question, I will definitely let you know whatever I  
7 find on this, because it's really a big interest of mine at  
8 this point, is looking at the flow of products around the  
9 planet as a vehicle for carrying dangerous chemicals around  
10 the planet, and thinking about that question, how do we  
11 address that particular issue?

12           In terms of prioritization, I mean, I thought you  
13 did such a good job at laying out the criteria for  
14 prioritization, when you actually did the first selection of  
15 products, that I don't know that I can offer much, but just  
16 the things that you did before, which is here is a place I  
17 think exposure -- while I'm hesitant about using exposure  
18 heavily in thinking about substitutions and things like  
19 that, I'm not here, on prioritization. Exposure is a very  
20 important -- the variability of exposure itself is really  
21 important.

22           The availability of alternatives, or, actually,  
23 the unavailability of alternatives, ought to be another  
24 criteria for thinking what is the range or possibility of  
25 alternatives in the space of that product category, which I

1 think is an important one.

2 I also like the projective quality of what Ann  
3 suggested as the "ripple effect." I think it is really a  
4 useful vehicle for thinking about prioritization as well.  
5 What if we chose this product, and what would happen down  
6 the line or throughout the sector as others become aware of  
7 and interested in that?

8 I think the food packaging product category has a  
9 lot of that potential. If California is looking at food  
10 packaging, it's one more message about food packaging that  
11 could be -- goes into all kinds of packaging, clothing  
12 packaging, all kinds of packaging, huge amount of our waste  
13 stream, and it also is carrying a lot of really heavy  
14 chemicals into water, air, human life, and, also, I think  
15 it's an under-considered area for this.

16 Challenges. By my hesitancy about the  
17 construction materials, I was really focused on the  
18 structural materials, not other building materials,  
19 which was my concern, but it also has to do with just  
20 how that would be -- structural products would be a  
21 difficult area, I think, to wrestle in, just because of a  
22 lot of the struggle that is going on with the U.S. Green  
23 Building Council and all, but it seems to me that also is an  
24 opportunity. So I can see what that might be a useful area  
25 for work.

1               So those are my, unfortunately, random thoughts.

2   So thank you very much.

3               PANEL CO-CHAIR MORAN:   Thank you, Ken.

4               So we're continuing to go around on the last three  
5   questions on the Work Plan, and so we'll be going next to  
6   Elaine and working our way back around towards Mark, who, if  
7   he wants to say anything about the Work Plan, would be  
8   welcome to do so.

9               PANEL MEMBER COHEN-HUBAL:   Okay.   Thank you.   So  
10   I'm just probably going to focus on priority products and  
11   methodologies.   So one of the things that struck me about  
12   the work plan, and really the program in general, is there  
13   is a focus on sort of "data rich" in the landscape of what  
14   we consider to be data rich here, you know, sort of data  
15   rich product chemical categories?

16              I question that just a tiny bit, especially in  
17   terms of things like cleaning products and personal care  
18   products, in terms of, so what's the added value of DTSC  
19   sort of jumping in and engaging there, when there is so  
20   many -- there are other active initiatives that have been  
21   and are pushing sort of change in those areas?

22              So, in some ways, you know, while there's some  
23   line between "There's just no information, you know, for us  
24   to even begin to tackle it," versus "We know this is a  
25   problem, and so does everybody else," where is, you know,

1 sort of this nice sweet spot where, again, you can really  
2 make an impact and drive development of information and  
3 methods where there aren't any? And, you know, that doesn't  
4 mean a bandwidth thing, but I think it's an important  
5 consideration.

6           The other thing that I would just throw out there  
7 is, in Office of Research and Development, we, you know,  
8 spend a lot of time on what we're now calling  
9 "pre-prioritization," because, of course, "prioritization,"  
10 in the different jurisdictions under different legislation,  
11 means something specific, with certain time lines and things  
12 like that, and pre-prioritization is -- so you've heard a  
13 lot from people about "There's lot of information. There's  
14 all these -- there's lot of information on chemicals.  
15 There's lot of information," but the pre-prioritization  
16 kinds of approaches that we're really actively working on is  
17 to just really to mine as much of that information, as  
18 quickly as possible.

19           Our focus has been on chemicals, and I think  
20 what's exciting about your program is its focus on the  
21 chemical product combination, and we've started to work with  
22 you a little bit on how our approaches might be  
23 transferrable, but I think it would be really exciting to  
24 sort of, now that you have a little bit of in-house  
25 capacity, to maybe take on some of those approaches and

1 tools, and we could do some transfer, and work with you to  
2 really take advantage of that.

3 I will echo this screening on exposure potential,  
4 and I do think a lot of the tools that we've been talking to  
5 you about, and this pre-prioritization, could really focus  
6 on potential exposure, because, again, that's what's  
7 exciting about the product, chemical focus, is that that  
8 really is that exposure interface. So I'll leave it at  
9 that.

10 MS. HOLDER: So I think that, now that you have  
11 articulated the policy prioritizes within each of the  
12 product categories, that you have to use that as a lens.  
13 That becomes your first criterion for this, and it should  
14 help. It should help now quite a bit, and there is some  
15 excellent work in other places to kind of start pointing in  
16 that direction, and, particularly, the example that was in  
17 my head was children. Okay. So how are children impacted  
18 in each of these categories and, you know, is there an  
19 obvious intersection of that in exposure potential and  
20 impact?

21 One of the methods that might be useful would be a  
22 "day in the life" view of it, where you walk through all the  
23 different potential intersections with each of these  
24 different categories, and then you find the one that pops  
25 out as the obviously starting point. It will usually be

1 obvious, of what to do. So that might be an exercise that  
2 could help you.

3           On the expected gaps, many of them are the normal  
4 ones. Economic impacts are going to be -- it's sometimes  
5 not even apparent what that impact is, in some of these  
6 cases, or it's just not been quantified. So I expect that  
7 to be a gap, emerging contaminants, especially for new  
8 things. There are new things coming out all the time in all  
9 of these categories, new materials, new products, and so  
10 it's very difficult to figure out, out of that space, what  
11 to focus on.

12           Again, data on the performance of alternatives.  
13 If there's someone who's using something that's not the  
14 mainstream solution to a particular technical need or  
15 whatever, it can be a challenge to get a full view of that  
16 substance or material.

17           Then, kind of echoing the exposure and emission  
18 question, is that that will probably be a fairly big gap.  
19 The good news is that it can be -- it's relatively  
20 straightforward, in fact, to fill some of those gaps,  
21 because those methods are known, of how to do those  
22 measurements, but we have found that it's not always already  
23 known, some these emissions, and those measurements, someone  
24 has to do them. So those are the comments.

25           PANEL CO-CHAIR FONG: I think I want to follow

1 Julie's lead and -- well, hang on. Actually, I do have one  
2 topic. Sorry.

3           So I do have a comment on closing data gaps. I  
4 think one thing that's really important to note is that  
5 companies -- or there's an increasing momentum towards  
6 transparencies by company. So Jack has mentioned in a  
7 previous discussion about information on fragrances, which  
8 you can actually access from a web site, and I've mentioned  
9 in another panel discussion that Apple is collecting full  
10 materials disclosure, you know, chemical ingredients on all  
11 of the parts and components, and we have accomplished  
12 getting at least the first level of full materials  
13 disclosure information on over 20,000 parts and components.

14           Now, that's not to say that those companies,  
15 including -- I'm sorry -- companies will just make that  
16 information publicly available right now, but, before we can  
17 actually do that, we have to know what is. So we're  
18 actually -- so companies are really building transparency  
19 into their way of doing business, so I think that's going to  
20 be really helpful for DTSC's effort.

21           The part about prioritization, I do agree with the  
22 fact that there are other organizations doing, you know,  
23 prioritization based on a lot of chemical management-type  
24 programs, but I want to throw a caution in there, because  
25 most of those prioritization schemes are based on hazard, or

1 primary focus is on hazard, and I don't think that's enough  
2 for this particular program. So, yes, make use of that  
3 information, but keep in mind that you need to go beyond  
4 just hazard. Thank you.

5 PANEL CO-CHAIR MORAN: So we have a break  
6 scheduled for right now, but I think we're really close to  
7 wrapping up this part of the discussion. So I wanted to see  
8 if anybody is going to object terribly if we extend for  
9 another few minutes. All right.

10 Mark is going to be free to make any comments on  
11 the Work Plan that he wants to make. I have a few comments,  
12 and then I'll solicit whether there's items we want to  
13 follow up on. We might want to do that follow-up after the  
14 break, but we'll see how much there is there.

15 PANEL MEMBER CARINGELLO: Okay. It never works if  
16 I say I'm going to try and be brief, so I won't even promise  
17 that, but, on the anticipated challenges, I commented  
18 earlier that some of the categories are very broad, so I  
19 think that's going to be a challenge, is how do you narrow  
20 that down?

21 I think I want to echo what Helen said, is you've  
22 done a lot of work towards that by setting the priorities.  
23 Those priorities -- or those policies. Those policies will  
24 guide your priorities, and that will also help you bring  
25 some of those broader categories down. So I think that

1 challenge, a chunk of it, is taken care of.

2 I think another challenge is, as you do that, make  
3 sure that, because one of your policies is around  
4 wastewater, that you mesh with other agencies in the state.  
5 When you look at something that's voluble, carb assumes it  
6 all goes up in the air. If it's all going up in the air and  
7 attacking the ozone, it's not getting in the wastewater,  
8 which, scientifically, we know that's not the case. So I  
9 think there's just some careful treading that you'll have to  
10 do with how do you describe that, how do you close that data  
11 point?

12 I'd also say -- Jack mentioned Health Canada.  
13 They will be another good source if you look at the food  
14 packaging. They did a lot of work around that. I think the  
15 data gap goes back to what Ann was talking about, is if you  
16 look at that, and you want to look at the aquatic  
17 environment, how that's affected by it, I think that might  
18 be a data gap, but I think there's a lot of information out  
19 there to at least start that process.

20 Another couple things to look at. I think a  
21 challenge is going to be, things are changing so rapidly  
22 right now that information that you could use to help  
23 identify specific products, help with your data gaps, is  
24 right now being generated, and the examples I'm thinking of  
25 are, in California, you've got the ingredient disclosure

1 requirements that really come into effect in 2020. So it  
2 does help you with this current Work Plan, but it's coming  
3 up. But it's going after some of the products in the Work  
4 Plan.

5           So industry is working on that, and it might be  
6 able to get you -- it might help you narrow some of those,  
7 because, as ingredients are disclosed, and people are going  
8 back into their vendors to find out some of the components,  
9 you might find that those filter themselves out. So I think  
10 the timing for you is very good to say, "This is on our  
11 radar," for people to be looking at that while they're  
12 looking at ingredient disclosure.

13           Also, the TSCA reset is ongoing right now. People  
14 are busily feeding in information of "Here are the chemicals  
15 we know we're using." It's not getting down yet to the  
16 level of processors saying where everything is going, but,  
17 again, maybe some of these chemicals will disappear off the  
18 inventory or, if EPA sees that they're used in very limited  
19 quantities, EPA might be taking action.

20           Again, it's so early. I mean, the manufacturers  
21 just submitted their Form As. Processors have another  
22 period of time before they have to do theirs. But that is  
23 information that's coming, and I think, you know, it might  
24 help to some extent, but it's just not there yet.

25           PANEL CO-CHAIR MORAN: Mark.

1           Panel Member NICAS: I want to begin by  
2 apologizing for my absence. I was on a phone call for a  
3 committee of another organization having to do with the fit  
4 capability of respirators, not something that this group  
5 deals with, but it was interesting because the issue of  
6 transparency was discussed, and, unlike this group, the  
7 majority there weren't in favor of transparency. They  
8 didn't want to release their results. They just want, "The  
9 government okays it, that's fine. How did it perform?  
10 Well, no one needs to know that." I've summed it up pretty  
11 well, too.

12           My comments are very brief. You know, of the six  
13 product categories listed, the ones that I am in favor of,  
14 just because I think that they have the broadest impact,  
15 just on numbers of people, would be cleaning products, and  
16 also the potential for more acute high-level exposures in  
17 cleaning products, household school and workplace  
18 furnishings, because we all live in houses and apartments,  
19 residences, furnished, and food packaging, you know,  
20 because, clearly, we all eat food.

21           The challenge I see, which is really not unique to  
22 any of these categories, I would imagine, is the rapidity of  
23 change of the recipes that go into it. So, you know, you do  
24 an alternatives assessment on three products, and by the  
25 time you finish, there are three more. So that's what I

1 see on major challenges, yes, and there's ongoing data gaps  
2 for sure.

3 PANEL CO-CHAIR MORAN: Thank you.

4 Just to wrap these up before we see if we'll have  
5 a discussion or not later, I'll just make a few brief  
6 comments. So I think that we've pretty well fleshed out the  
7 anticipated challenges.

8 I think one of the themes that I want to mention  
9 in that, and addressing data gaps, is that sometimes you can  
10 use proof of pathway from one chemical in the product to  
11 show another chemical also probably has the same pathway,  
12 and some of the biggest opportunities for learning in this  
13 area is with chemicals that have very limited use.

14 So I've seen this in the pesticide arena as being  
15 incredibly powerful, that if you find -- sometimes the  
16 chemicals that yield the most interesting information are  
17 those where they're only used, say, in building paint, or  
18 only used in one particular way, and if you can trace that  
19 pathway, if the chemistry is very, very different, perhaps  
20 that pathway doesn't work, but understanding that the  
21 existence of a pathway that might not be known is often  
22 revealed through a chemical that has very little other uses,  
23 so that you can distinguish the source more clearly, and  
24 that's something, I think, that both points at using the  
25 literature and also towards research, which we'll get to

1 next.

2 I would urge and just remind the department, which  
3 I think you're keenly aware of, that you have the authority  
4 to work on severes, and not just widespread impacts. So  
5 that is going to be an issue here. We're talking a lot  
6 about "widespread," but when we're talking about some of the  
7 exposure scenarios, they are going to be severe and not  
8 widespread.

9 In terms of prioritization methodologies, it seems  
10 to me one of the key parts of this is having good  
11 systemization of your data storage around chemicals, and I  
12 know that you guys have worked extensively on that, and will  
13 probably need to continue, and you shared with us this  
14 environment and climate change candidate prioritization  
15 system, which really boils down to an ongoing literature  
16 review and having a way of storing it for later assessment,  
17 and having a great set of questions for reviewing the  
18 literature, and that leads me to two things.

19 One is that I think it's exceedingly important  
20 that the department have the ability to have ongoing  
21 scientific literature review, so scientists being able to,  
22 at their desk, access all the journals, and I understand  
23 there have been some barriers to that.

24 I'm hoping that's resolved, but it's crucial that  
25 the department scientists have the ability to access

1 scientific literature directly, and that you have -- I would  
2 encourage you to establish a program where you've identified  
3 the major journals, and figure out who's tracking those, so  
4 that you can get stuff into your databases, because,  
5 personally, I have found that, and I've seen this in other  
6 places, as being just an incredibly powerful source.

7           It's usually not one paper that triggers  
8 something. It's papers over the period of five years that  
9 eventually tell the story about a chemical and a product,  
10 and so having the ability to store that, and then come back  
11 and look at it every so often, is going to be an important  
12 part of the toolkit for the department. Not having access  
13 to journals at the desk I've seen over and over again as  
14 being a huge barrier to scientific success, so efficiency,  
15 but also just information. So that's really big.

16           Then the last thing is that, every so often, there  
17 is a paper that's new that reveals something new that's  
18 major, and having some sort of common understanding among  
19 the scientists in your program as to what's a major new  
20 thing, that ought to trigger some discussion with management  
21 about it, is something that I think is a really good idea  
22 for you, because there's lots of things that are  
23 interesting, and they get press, but only a few things are  
24 really scientifically major in this area, and having that  
25 trigger, and then saying, "Okay. Based on this new thing

1 that just happened, that's major, let's go pull out our  
2 database for things related to that, and have a look at it  
3 to see if there's something that would change our priorities  
4 for our work going forward."

5           So those are a few thoughts. So now what I want  
6 to do, since we're beyond where we were supposed to be for  
7 our break, is there interest in follow-up discussion on  
8 anything here, or do folks have any add-on items? If it's  
9 just real brief, let's just do it, and then we'll go on a  
10 break.

11           PANEL MEMBER COHEN-HUBAL: And of course my mind  
12 is blanking on this, but you triggered something in terms of  
13 the literature review, and Carolyn Mattingly at NC State has  
14 the -- I'm blanking on the name of her on-line resource.  
15 Whatever. I'll figure it out. It's three letters,  
16 C-something, and she has added to that, so it has genes  
17 endpoints, tox endpoints, and chemicals, and she's added  
18 extensive curation of exposure literature.

19           So it's very high-level, doesn't tie to products  
20 or whatever, but it ties chemicals, and so then it infers  
21 connections where there's one in the literature, you know.  
22 So it's a really exciting resource. I haven't spent a lot  
23 of time to see how the exposure piece has, you know, sort of  
24 played out, but I was very involved in the early sort of  
25 development of that ontology. So that might be just

1 something in terms of the literature being curated and  
2 easily accessible.

3 PANEL CO-CHAIR MORAN: Any other quick follow-up?  
4 Is it fair to say that we've wrapped our discussion on the  
5 Work Plan? I think I see -- yes.

6 UNIDENTIFIED SPEAKER: (Indiscernible.)

7 PANEL CO-CHAIR MORAN: Yes. You're good?

8 DEPUTY DIRECTOR WILLIAMS: I mean, I could go  
9 either way.

10 PANEL CO-CHAIR MORAN: Okay. Well, I mean, if  
11 there's anything else you want, we could come back after the  
12 break and spend a couple more minutes on the Work Plan, or  
13 we could move into the research agenda.

14 DEPUTY DIRECTOR WILLIAMS: (Indiscernible)  
15 anything else.

16 PANEL CO-CHAIR MORAN: So Meredith is saying that,  
17 if anything thinks of something on the break, we'll come  
18 back after the break and ask for one last chance. If it's  
19 something that isn't going to be useful as a general thing,  
20 please feel free to communicate directly with staff. We  
21 can't talk to each other, but we can talk to the staff about  
22 it.

23 So let's take a 15-minute break, and so that would  
24 be, let's see, 12 after 11:00, and we'll come back and do a  
25 check-in on the Work Plan, and then proceed into the

1 research agenda.

2 (Off the record at 10:56 a.m.)

3 (On the record at 11:14 a.m.)

4 PANEL CO-CHAIR MORAN: All right. This is your  
5 30-second warning. We're going to restart. All right.  
6 We're just about to reconvene.

7 All right. Welcome back to the Green Ribbon  
8 Science Panel meeting. Before we do a quick check-in on the  
9 Work Plan, and then move over, I'm going to turn things over  
10 to Art for the research agenda.

11 I want to point out that in your packets, panel  
12 members, there's a tab labeled "Agenda" that's actually not  
13 agenda, but it's about -- probably because that's how  
14 they -- at least, mine isn't -- that's about financial  
15 reimbursements, and there's a set of forms there.

16 So, if you want to have your travel costs  
17 reimbursed, which is provided for in the statute, then you  
18 need to fill out these forms and send them back to DTSC, and  
19 if you have questions about filling out the forms, Valerie's  
20 contact info is on the first page of that last section.

21 You also have an e-mail from Valerie in your in  
22 box, with examples of the completed forms that I hope will  
23 make it easier to fill them out. So, if you want your  
24 reimbursement, you've got to take the initiative and fill  
25 the forms out, and you have an envelope, but you will have

1 to provide the stamps in the back of your package to do  
2 that, and do follow the instructions carefully. The state  
3 travel people are really, really anal about this stuff, so  
4 get that right.

5 So, with that, are there any last thoughts on the  
6 work plan? And, hearing none, I think we'll turn this over  
7 to Art, and we'll tack the research agenda.

8 PANEL CO-CHAIR FONG: Thank you, Kelly. So  
9 Meredith is going to set up our discussion on the research  
10 agenda by explaining the importance of DTSC engaging with  
11 the research community, and setting up the question that  
12 DTSC has for the panel.

13 Meredith.

14 DEPUTY DIRECTOR WILLIAMS: Thank you, Art.

15 I don't know how many of you have had the pleasure  
16 of participating in any of the recent discussions about the  
17 emerging tools that are coming on line, be that predictive  
18 tox, the Tox21 effort. There was a big meeting a couple  
19 years ago, a year and a half ago, on the 25th anniversary of  
20 endocrine-disrupting science, and it's just very clear that  
21 things are changing very rapidly.

22 What I see happening is that people are looking at  
23 a lot of that emerging science and a lot of those emerging  
24 tools with the existing regulatory decision-making  
25 frameworks in mind, so taking these new tools and applying

1    them as the way everything else has been applied, and  
2    they're struggling to do that in some ways, but Safer  
3    Consumer Products is a very different place.

4               We have the opportunity to be precautionary. We  
5    are not necessarily taking action immediately for risk  
6    management or for the regulatory responses. It gives us  
7    some time, and, therefore, we have a degree of flexibility  
8    that a lot of other regulatory agencies don't have, and that  
9    gives us the opportunity to take advantage of some of these  
10   tools and new research sooner than some other organizations  
11   could, and I think that's a tremendous opportunity for us.  
12   At least once every half-hour, the phrase "data gap" comes  
13   up, and a lot of these tools are tools that could help with  
14   data gaps.

15              So the other thing I heard yesterday throughout  
16   the discussion were, there were places where just the bread  
17   and butter, not necessarily the new bells and whistle  
18   science is coming on line, but monitoring programs,  
19   increased ecological toxicology endpoint characterizations,  
20   things like that, some of those things need to be addressed,  
21   too.

22              So we aren't a huge source of funds. However, we  
23   are out there in the world, and we want researchers to know  
24   what our needs are in terms of decision making, and we'd  
25   like to start to talk to you about what you perceive as our

1 needs, and how you think we can best influence the  
2 conversation about what research priorities should be, and  
3 how to explain to researchers how they can link their work  
4 back to us, how results and tools can be translated into our  
5 decision-making framework.

6           So we wanted to open up that conversation. It's  
7 not a "one and done" conversation. I imagine we'll come  
8 back to it from time to time. But certainly I wanted to get  
9 a first pass of your perception about where we are and what  
10 we can do to really advance the research agenda, and  
11 incentivize researchers to keep us in mind as they do their  
12 work.

13           PANEL CO-CHAIR FONG: Thank you very much for  
14 setting up the conversation. So let's see. Actually,  
15 didn't we ask -- are there specific things on the this, the  
16 questions that you have up on the slide, that you would like  
17 us to key in on?

18           DEPUTY DIRECTOR WILLIAMS: So the idea for these  
19 questions was really to get your juices flowing. It wasn't  
20 to march through them, necessarily, and cover each one,  
21 because it is a broad topic, right? And so I think the  
22 points of insertion are important. Where is it that --  
23 what's the mechanism by which we can help influence the  
24 research agenda? That would be the one question that I  
25 would say would be particularly interesting to hear from you

1 about.

2 PANEL CO-CHAIR FONG: All right. Thank you.

3 Actually, I was just reminded that, in fact, we do  
4 have a comment over the web. So it's a short comment.

5 So, Marcus, would you mind just, before we get  
6 into this discussion, take care of that, please.

7 MR. SIMPSON: Bear with me for a split second,  
8 Art, while I get the comment booted up. Thank you.

9 So, folks, this comment was submitted at the tail  
10 end of the comment period a while ago, and just before the  
11 panel convened for discussion. It was sent from an on-line  
12 audience member. Her name is Laura Rosenberger Haider, and  
13 the comment reads, "Priority to chemicals linked to  
14 cognitive/slash brain impairment." Thank you.

15 PANEL CO-CHAIR FONG: Marcus, thank you very much.

16 So we'll start our discussion on the research  
17 agenda. Let's go around the room, starting with Elaine.

18 PANEL MEMBER COHEN-HUBAL: Okay. Thank you. I  
19 had a couple thoughts, and I think -- so, you know, I just  
20 thought about this. I'm just going to end up saying the  
21 same thing that Meredith just said.

22 I saw kind of three goals, potential goals for  
23 research, and one would be filling data gaps, and not just  
24 filling data gaps, but facilitating access to information.  
25 So that's increasing transparency, and encouraging that

1 ingredients are listed, and things like that, but I see that  
2 as a research goal, supporting in-form substitution and  
3 avoiding unintended replacements and consequences across the  
4 board.

5           Then the third I thought about is in terms of  
6 proactive policy, and this is the point of the legislation,  
7 is to change the way manufacturers think about and do  
8 product development to support safer design, but then I  
9 think there's potential here also to change the way that  
10 regulators monitor for and ID problems, and so the couple  
11 research activities, you know, that I would like to just  
12 throw out as things that should be on the radar in terms of  
13 potential investments, but certainly looking for ways to  
14 access and encourage these kinds of activities, are the  
15 nontargeted analysis tools and suspect screening, you know,  
16 which is a subset of those, certainly in the water supply,  
17 to build out methods for proactive monitoring.

18           I know a lot of states are working in this area,  
19 and probably your state is, too, but there's a lot of power  
20 and potential here as we sort of all learn together about  
21 how to implement these methods and then really take  
22 advantage of what we can and should be learning from those  
23 methods, and how those would inform your priority selection  
24 of products and chemicals, and then, using those same kinds  
25 of tools, to get at what are the chemicals in products and

1 chemicals, and build out that database, and also be in a  
2 position to address the point made earlier about the fact  
3 that what's in products and what products are out there is  
4 such a moving target.

5           So, just sort of -- I mean, I guess I come from a  
6 world where we spend a lot of time and energy both in  
7 investment in terms of the tox testing and a lot of  
8 different tools for accessing existing -- at collating,  
9 making very accessible information that's out there on  
10 whatever chemicals and products are out there. So we've  
11 been working very hard on that, and those tools are more and  
12 more accessible, and increasing in power, and then, in terms  
13 of the bioprofiling and those kinds of tools, we've spent a  
14 lot of time on that.

15           So there's certainly -- I mean, I could go on and  
16 on about opportunities there, and things that the agency  
17 could take advantage of, but I think there's a lot of  
18 thinking and documents and opportunities around there. So I  
19 just wanted to throw out there other two because, for us,  
20 they're a little bit newer.

21           We're starting to really take advantage of both of  
22 these potential approaches for sort of figuring out where  
23 are there signals that we aren't going to see without sort  
24 of just going and looking, avoiding the whole "under the  
25 lamp post" biomonitoring kinds of approaches, and we're

1 starting to particularly see power where -- I mean, this is  
2 how the GenX was identified in the water bodies in North  
3 Carolina, and then it's also the approach that we've  
4 got -- if the paper isn't out, then it's coming out, but  
5 where these kinds of methodologies were used to look at 20  
6 different products and just see what's in them that we might  
7 expect or might not expect. So that type of data is  
8 becoming available, and is going to be increasingly  
9 interesting to take advantage of.

10 PANEL CO-CHAIR FONG: Thank you, Elaine.

11 Ken.

12 PANEL MEMBER GEISER: Yes. So I'm going to here  
13 reference a paper that I think, Ann, you and Joel and others  
14 were a part of, that laid out, I thought, a really nice  
15 trajectory of research needs in advancing alternatives  
16 assessment, and rather than highlight it myself, if you feel  
17 comfortable, I would just pass this to you, in your time, to  
18 sort of -- if you would go through some of those issues.

19 PANEL MEMBER BLAKE: (Indiscernible.)

20 PANEL MEMBER GEISER: I can say a little bit about  
21 them, if you want to.

22 PANEL MEMBER BLAKE: (Indiscernible.)

23 PANEL MEMBER GEISER: Yes. Well, maybe what I --  
24 here's a suggestion. When it gets to you, why don't you say  
25 something about it, and maybe I'll step in and sort of say a

1 few of the things I thought important from it, because I  
2 thought that was a really good review of some, but, in  
3 addition, then, I would just add a few that are just my  
4 thoughts about this.

5           One of them, and, obviously, this kind of comes  
6 from my own interests as well, and that is, in order to  
7 carry out the functions that are in the Safer Consumer  
8 Product reg, DTSC has been challenged to really take a look  
9 at chemicals in products, and, to the degree that you're  
10 developing capacity, to really identify chemicals in  
11 products, and to begin to build databases, or think about  
12 what databases you use and all.

13           To do that, I would really be pleased to see that  
14 the department really took a lead in really building -- and  
15 maybe this is cooperative among states. Maybe it's working  
16 with other research institutions, or working with other  
17 associations, business associations or whatever, to really  
18 build a robust chemicals-in-products inventory, a registry  
19 of some kind where we really are doing that.

20           Now, I know Jack has mentioned that, you know,  
21 using SmartLabel as a vehicle for this, but it's just --  
22 I don't know what is the right way to do it, but it seems to  
23 me that it would be very helpful to you, but it would be  
24 very helpful to the rest of us if that were going on.

25           In terms of substantive area, I think, you know,

1 I've heard -- maybe this is a bow to Kelly, because she's so  
2 wonderful at reminding us, time and time again, of the great  
3 gaps in ECOTOX. I'm convinced, when I'm looking at stuff at  
4 this point, too, the weakest areas that I'm finding are in  
5 ECOTOX studies, and, given that the few species that have  
6 actually been studied at all just sort of tells us how much  
7 we don't know about so much, and the fact that we're using a  
8 few species to stand in for the entire animal kingdom is  
9 like -- I mean, you know, how did we get away with that?

10           So I really would encourage more research in this  
11 area. Whether that's a DTSC thing I don't know, but along  
12 with that, and because of California, it seems to me  
13 research on water contamination and water as another area  
14 that would be very useful to have more information on as  
15 well, and I'm thinking about things like, let me just say,  
16 mixtures and interactions in water, and complexities in the  
17 dynamics of water chemistry itself would be very  
18 interesting, it seems to me, to take up.

19           So what I'm not saying, and trying to be clear, I  
20 wouldn't do a lot of -- I don't think DTSC needs to do a lot  
21 of human toxicology work, and there are so many fabulous  
22 institutions that are doing this work, and, you know, unless  
23 there's really some very targeted and specific thing, I  
24 don't see that as an area that makes as much sense. But  
25 those are my thoughts. Thank you.

1           PANEL MEMBER LINARD: I think, as I look at the  
2 questions, I focus on how we can help DTSC do its job  
3 better. So one of the things which I've jotted down is "Get  
4 involved, network," things you're already doing. How do you  
5 do it without a lot of resource, i.e., money?

6           I think you've got a good start in the events we  
7 mentioned yesterday, the CTEC (phonetic) meeting here.  
8 That's a good way to get exposure without costing you an arm  
9 and a leg. SOT is another good way, if you can just get  
10 involved and be present and be seen. Those are really  
11 important things, I think, in order to let people know that  
12 you want their information. If people know you want their  
13 information, you're going to get it, and I think that's  
14 important when you're looking at ways to maximize the  
15 efficiency of your operation.

16           In terms of some other things, looking at other  
17 regulatory agencies, can you trust their information? And I  
18 look at ECA. We mentioned the European Chemicals Agency  
19 yesterday, but by law, by regulation in Europe, they're not  
20 allowed to give out and make public all the basic studies.  
21 They can give their conclusions, but the basic studies are  
22 subject to confidential business information.

23           Will you trust their analysis? What would it take  
24 for you to trust their analysis? And I don't know. I'm not  
25 that -- the same goes for cosmetic safety in Europe, the

1 SCCS, and I did get the acronym. It's the Scientific  
2 Committee on Consumer Safety, which evaluates all these  
3 ingredients that you've listed under the beauty and personal  
4 care segment. They give all the usage instructions, and, to  
5 be honest, we follow them, as well as the cosmetic  
6 ingredient review.

7           SCCS is a closed body, but, again, do you trust  
8 the results of their analyses? How much confidence do you  
9 have? So, if you can develop some ties with them, to say  
10 their do their job right -- I don't have those ties, but I  
11 know other people might. It is a government -- I think it's  
12 more of an advisory body to the European Union, but it's  
13 that type of thing.

14           Cosmetic ingredient review is -- all meetings are  
15 open to the public. All findings are published. So, again,  
16 you're free to attend the meeting in person. You're free  
17 to comment on any of the submissions for that particular  
18 area.

19           How to do things? I know, if you have a specific  
20 issue, invite, in my case, industry in to talk. We're happy  
21 to have a full-day session, public meeting. We can do that  
22 on a particular topic. I know I coordinated one some seven  
23 years ago now, six and a half years ago, on alternative  
24 assessments. I still use a lot of the presentations that  
25 industry gave at that one. We subsequently gave similar

1 ones to the Interstate Chemicals Clearinghouse.

2           So, again, these are things you can do without a  
3 whole lot of resource, but it gains a lot of traction,  
4 because you tell people that you're going to use their data.  
5 If you use their information, people are going to be -- they  
6 really want to -- they want to see their database being  
7 used, too. It's in their best interests to have you want  
8 it. So, I think, you know, just get the word out that this  
9 is stuff you're looking at.

10           Now, what does this program do that others -- and  
11 I know we've touched on it. Yes. We can talk about the  
12 hazards of a chemical. We can talk about the exposure  
13 assessment. But putting it into a product is something that  
14 you do that's unique. There aren't many other agencies,  
15 groups that are actually looking at that, the product safety  
16 itself, or the safety of that chemical in a product with a  
17 certain exposure.

18           So I think that's the uniqueness that you've got,  
19 and you can actually then command information, say, "We need  
20 some help on this." People are going to come. I can  
21 guarantee it. I mean, if you said, "I want a full day on  
22 something," I think you'd probably get quite a bit of  
23 cooperation.

24           The other group that I just want to mention  
25 quickly is -- I mean, people think fragrances are black-box

1 materials, but there is a research organization which is  
2 focused entirely on fragrance safety. The Research  
3 Institute for Fragrance Materials has some really good  
4 methodology for assessing the safety of a fragrance  
5 ingredient as it's being used, both human health and, more  
6 and more, the ecotox evaluations. So they may not have done  
7 every fragrance ingredient, but they do have some phenomenal  
8 methods in assessing safety.

9           Then, lastly, I know we got a report on ICVAM. If  
10 you look at alternatives to animal testing, I mean, again,  
11 it's an alternative assessment. It's being done globally,  
12 but also by EPA in the U.S., as well as ECVAM in Europe.  
13 This is very hot. There are bills being proposed in  
14 California and then federal to ban animal testing for  
15 a -- well, this is serious.

16           We want to do it, too, but we want to look at the  
17 next generation of risk assessment. How do you actually  
18 assess safety if you don't have animal testing available?  
19 EPA is at the forefront of looking at how we're going to do  
20 this in the future.

21           So I think, again, you can get involved and see  
22 what's coming down the road, but it's also -- as you say,  
23 you have a little bit more flexibility. You can actually  
24 say, "Let's do a pilot here," and test out some of your  
25 concepts, which another regulatory agency may not be able to

1 do.

2 PANEL CO-CHAIR FONG: Jack, thank you very much  
3 for those insightful comments.

4 Ann.

5 PANEL MEMBER BLAKE: Thank you. I'm going to echo  
6 and build on something that Jack said, and expand that to  
7 methodologies beyond data, and say that perhaps, you know,  
8 we've done pretty well through (indiscernible) as  
9 indicating -- signaling some data needs and methodology  
10 needs, but perhaps do that a little more intentionally, and  
11 engage with -- specific targeted engagement with people who  
12 are developing methods currently that are relevant to your  
13 regulatory scope.

14 So we've talked a lot about the gaps in ecotox, so  
15 engage with the people that are trying to develop the  
16 methodologies that fill in the gaps that we need, and then,  
17 more specifically, perhaps, exposure assessment around  
18 exposures, and workplace exposure sites, some of the ones we  
19 mentioned specific to the broad product categories in  
20 chemical exposures, where those simply don't exist. People  
21 have not done those. So, once again, I'm a broken record on  
22 the nail salon exposure, but we can talk about that further.

23 Ken, thanks for highlighting the alternatives  
24 assessment community of practice. I worked fairly hard to  
25 bring together a research agenda, and I couldn't quickly

1 find that paper, but we can send it to you.

2           DEPUTY DIRECTOR WILLIAMS: I'll just say that we  
3 don't need that paper, because it was referenced at the  
4 Environment Canada/Health Canada Science Committee meeting  
5 quite recently.

6           PANEL MEMBER BLAKE: Brilliant. Okay. Fabulous.  
7 And, of course, we had work groups in hazard exposure and  
8 decision, which is -- since I was focused on the decision  
9 side, I couldn't quickly remember what the other high points  
10 were, but, anyway, so that's available.

11           I would also say to continue to do some of the  
12 engagement that you already have on the alternative side.  
13 So we've talked about alternatives assessment methodologies,  
14 but, specifically, you've partnered with academia, such as  
15 the U.C. Berkeley Center for Green Chemistry, on specific  
16 solution-oriented things, and your support for that type of  
17 solution focus, the Green Solutions class -- I'm channeling  
18 Meg Schwarzman here, since she's not here -- and those types  
19 of approaches, those are the kinds of things that I think we  
20 need to scale, and DTSC signaling that this is an  
21 alternatives assessment approach that works, and one that  
22 you support. That helps enormously, so specific targeted  
23 engagement on all those areas, developing methodology.

24           One of the methodologies I was thinking of, also,  
25 is cytotoxicity for PFAS, which I was bringing up yesterday.

1 These methods are in development now, and one of the  
2 challenges they've had is they don't really have feedback  
3 from regulatory agencies about their needs. So I think  
4 that's a huge area that DTSC could provide, you know, "What  
5 do you need in terms of information to take action in your  
6 regulatory scope?"

7 Meredith is looking puzzled. Did you have a  
8 follow-up question?

9 DEPUTY DIRECTOR WILLIAMS: That's a case where it  
10 would be very helpful to have specifics.

11 PANEL MEMBER BLAKE: I can follow up with you on  
12 that.

13 DEPUTY DIRECTOR WILLIAMS: Who is "they"?

14 PANEL MEMBER BLAKE: Yes.

15 DEPUTY DIRECTOR WILLIAMS: Yes.

16 PANEL CO-CHAIR FONG: Thank you, Ann.

17 Julie.

18 PANEL MEMBER SCHOENUNG: Yes. Most of the things  
19 I had on my list have already been said as we're going  
20 around the table, but that's fine. I wanted to just say a  
21 couple things, focusing mostly on the AA alternatives  
22 assessment, and going back to some of the things yesterday,  
23 and issues with data, not just data gaps, but data quality.

24 You know, we talk a lot about data gaps, but even  
25 the data we do have is not always consistent, and how do we

1 deal with data that we do have that we don't necessarily  
2 have strong confidence in. It's sometimes almost harder  
3 than if there's just nothing there, right? So how do we  
4 address that, both in a pragmatic sense, if you're using it  
5 in AA -- you know, how would we manage that? How do we  
6 address it?

7           How do we identify that this data is less reliable  
8 than that data that we're using in an AA, but also how do we  
9 promote the development of databases that it's easier to  
10 tell how reliable it is, and how much evidence there is to  
11 support that data in preparing your own assessments or for  
12 outsiders doing AAs?

13           We mentioned many of these yesterday, but I'm  
14 going to say it again anyway, and that is, the things you  
15 already know you need to fill the gaps of is relevant  
16 factors, and how do we develop proper methods to identify  
17 and assess relevant methods? I'll speak for Helen, because  
18 she'll always bring up economic analysis, and she's not  
19 here, and the decision making.

20           I think that what is expected within an AA in  
21 terms of articulating how to make a decision we touched on  
22 yesterday, but I think it's really important that we have  
23 that conversation further in terms of, should it be  
24 quantitatively determined or should it be qualitatively  
25 determined? And I'm not sure if it's the same paper that is

1 being referenced here in terms of AA, but the workshop that  
2 Tim Malloy had organized at UCLA a few years ago -- is that  
3 the same one?

4 PANEL MEMBER GEISER: Different one.

5 PANEL MEMBER SCHOENUNG: This is a different  
6 one -- also came out with a paper that was a conversation  
7 that came out of all the workshops, breakout sessions, and a  
8 lot of those discussions were the tension, if you will,  
9 between the academics and the industry and the government  
10 people, between is it okay to just qualitatively, and from a  
11 judgment and values system perspective, be able to say, you  
12 know, "Given all of this data that we've collected, this is  
13 what we think is the best choice, and why," or do you  
14 actually need a rigorous weighting of attributes and  
15 weighting of relevant factors, and, if so, how do we decide  
16 what that should be? And, you know, as brought up  
17 yesterday, how do you account for that value system of the  
18 firm? Should it be systematized in some way?

19 So those are things that I think there's  
20 opportunity for those different sectors, industry,  
21 academics, and governmental organizations, to try to  
22 continue that conversation of "What is appropriate in the  
23 regulatory setting in terms of allowing for a good decision  
24 to be defined, and for uncertainty and data gaps to be  
25 incorporated within that decision-making process and the

1 value systems that everybody has?"

2           Then the other thing I'm going to bring up again,  
3 and Ken mentioned it yesterday, and we've had it come up  
4 many times over the years, and that is mixtures. I think  
5 there's still a big need out there for doing more research  
6 on "How do we account for the fact that there's virtually no  
7 data on anything beyond cast number, identifiable chemical,  
8 and when you put that together into mixtures, how can we do  
9 that?" And there's been efforts to do that, but I think  
10 that's a challenge that's out there.

11           If you want to broaden the range of chemical  
12 product combinations you want to look at, you're going to  
13 get to a point where it's not as you have in the current  
14 work plan, where they're pretty identifiable, well, say,  
15 mostly organic-based chemicals. If you start to look at  
16 engineering chemicals, engineering materials, they're not  
17 going to be in pure form, ever, and so dealing with that,  
18 and that also leads to when you get to even more complex  
19 systems, like electronics and solar panels and other  
20 systems, and machinery and things.

21           I know your priority products have moved away from  
22 that, and maybe they aren't the route of most widespread or  
23 acute exposure, but I would hope those wouldn't completely  
24 fall off the radar as things that could certainly use the  
25 motivation of a regulatory agency pushing those industries

1 as well to be paying attention to what chemicals and  
2 substances they're using in their products.

3 If we always just end up pushing, "Well, that's a  
4 complex material system. It's not actually going to get out  
5 into the environment. People aren't going to see it," I  
6 think that it sends the message that they're always going to  
7 be on the back burner and they're never going to get on the  
8 radar. So there's a couple both pedagogical or  
9 methodological things, but also pragmatic, in the industry  
10 and the firms. So, thank you.

11 PANEL CO-CHAIR FONG: Julie, thank you very much,  
12 especially for bringing up the issue of data quality. I  
13 love that. Thank you.

14 Becky.

15 PANEL MEMBER SUTTON: All right. So I have a  
16 couple different ideas, here. First would be exposure, and  
17 here I'm thinking this would -- I'm thinking of this  
18 broadly, so including the stuff Mark would talk about, but  
19 also thinking about indications of exposure such as presence  
20 of chemicals or metabolites in humans or in wildlife, so  
21 monitoring data.

22 Then Ken mentioned ecological toxicity, so I guess  
23 I don't have to go into that one. That's covered.

24 I also wanted to bring up again nontargeted  
25 analysis. Here this is a very useful newer method that can

1 help get to some of these unexpected contaminants, might  
2 help to identify unexpected things that aren't under the  
3 lamp post Elaine mentioned. It can also be useful for  
4 identifying chemical classes, which could get to the  
5 impurities or, you know, the mixture of pure industrial or  
6 chemical products. So I know DTSC is developing  
7 capabilities in this area, and harnessing those could be  
8 very useful.

9           Also, nontargeted analysis for high-confidence  
10 identifications involves spectral libraries, so developing  
11 those libraries is a great idea. In addition, you can  
12 sleuth through existing nontargeted analysis data using sort  
13 of automated means to try and figure out the identities of  
14 chemicals where you don't have a clear spectrum, and so  
15 encouraging those developments could be useful for just  
16 taking older or existing nontargeted analysis data sets and  
17 trying to identify stuff that's already present out in the  
18 environment, and then, finally, encouraging product testing,  
19 including as it's in use or in situ in the environment.

20           PANEL CO-CHAIR FONG: Thank you very much.  
21           Mark.

22           PANEL MEMBER NICAS: And once my narrow world,  
23 both point of use and indoor air. Data on emission rates of  
24 the contaminants that are being sort of of concern would be  
25 certainly the biggest data gap, and certainly, then, what

1 requires research, and I think that a way to encourage the  
2 collection of that data that doesn't require money from DTSC  
3 would be -- well, really it would be, basically, publishing  
4 in peer-reviewed journals, not just posting on line, but  
5 publishing in peer-reviewed journals, examples of how  
6 missionary data was used to a good effect in an alternative  
7 assessment or as part of an exposure assessment, as part of  
8 an alternative assessment, and then an example of how it  
9 wasn't so good, and maybe the consequences or the outcome  
10 would have been better had, you know, better data been  
11 used.

12           It doesn't just have to be published, you know, by  
13 the staff. There could be working relationships established  
14 with academics -- that's not including me -- where DTSC  
15 could provide the information that it had about the exposure  
16 assessments, and then the academic, in collaboration, could  
17 sort of write up the paper and have it published.

18           Why would an academic want to do that without  
19 getting any money? Because the more papers that are  
20 published in an area, the more likelihood they will get  
21 funding for research in that area, and I can tell you that  
22 academics are always looking for research funding.

23           So I think that there's a collaborative  
24 relationship, and, you know, it doesn't have to do with  
25 exposure, clearly. I mean, every area that you deal with

1 can have this collaborative relationship with academics.

2 Now, I'll tell you just a quick example of  
3 missionary data. There was a product that was an ethylene  
4 oxide sterilizer meant for small offices, and it was  
5 basically a bread box, a ventilated bread box, and you would  
6 have a little ampule of ethylene oxide, and break it, and  
7 kind of throw it into a bag that contained the items that  
8 were meant to be sterilized.

9 Of course, you can imagine that the ethylene oxide  
10 gets out and goes into the room, and the company that  
11 marketed it had done some exposure monitoring, to their  
12 credit, but they had done it under a specific set of  
13 conditions, small room, high ventilation rate, and they  
14 repeated it six times, and what they got were exposure  
15 levels or room levels that were below regulatory limits.

16 So they advertised the product by saying, "Meets  
17 OSHA," you know, "There's no problem here," and what I did,  
18 you know, it wasn't rocket science -- although it was for me  
19 at the time -- was to basically tease out the emission rate  
20 data. They could have done it, but they didn't. All they  
21 did was monitor under one set of circumstances. But I  
22 teased out the emission rate data, and you could show that,  
23 under different use circumstances, really different  
24 ventilation conditions, that you could be above regulatory  
25 limits, and, in fact, it led to maybe one of the first

1 work-related Prop 65 cases.

2           So, I mean, it's an example of how emissionary  
3 data is more valuable, usually, then exposure monitoring  
4 data, because exposure conditions can vary quite a bit. So  
5 can emission rates, but maybe to a lesser extent.

6           So that's how I see, at present, DTSC could move  
7 forward emission research, is basically promoting the  
8 publication of peer-reviewed articles, and helping academics  
9 along in establishing that this stuff is useful to have.

10           PANEL CO-CHAIR FONG: All right. Thank you.

11           Mike.

12           PANEL MEMBER CARINGELLO: A lot of what I wanted  
13 to say has been touched on, so I apologize that there are  
14 some repeats, and some I've checked off, so I won't even  
15 talk.

16           One thing I wanted to mention is that, with major  
17 research areas and current funding, I think a key thing you  
18 have to do -- and this alludes to what Karl was talking  
19 about yesterday -- I really think that some of those funds  
20 need to go towards testing to verify that product that has  
21 gone through the process actually meets what people have  
22 said they were going to do, and not because you're being  
23 negative towards the stakeholders or you think people are  
24 lying, but because I think there are going to be cases like  
25 Karl was talking that there might be people that don't know

1     that those flame retardants are in those mattresses.

2                 That's not only, necessarily, the funds to do the  
3     testing, but there might be research on your part to say,  
4     "How do we test these mattresses that are on the market to  
5     see if there were the flame retardants?" And I think that's  
6     a key part to moving the program forward, is saying, "This  
7     isn't just a paper exercise. This isn't just we're going  
8     to, you know, do an alternative assessment and walk away.  
9     This is, we're making sure that the program is up and  
10    providing the safety that it is expected to do." So I think  
11    that's a very key area.

12                I think, as you look at methods, you need to be  
13    very careful to make sure that they're both meaningful and  
14    cost-effective, because, if you're going to develop a method  
15    for someone to use, what you want to be able to do is  
16    convince the stakeholder that "If you do this method, it's  
17    not going to cost you, you know, more than you're going to  
18    ever make on the product, and it's going to give you a  
19    result that is truly meaningful in real-life conditions."

20                I think a lot of methods exist out there. You  
21    know, we were talking earlier about "Okay. They test one  
22    animal, and that's supposed to encompass everything." How  
23    do we -- what research could be done to say, "Okay. Is  
24    there a method where we can take an in vivo method and then  
25    turn it into in vitro, and then into modeling, so it's much

1 more broadband, on an economically doable basis?" I think  
2 that's where you can make the bigger impact, is instead of  
3 doing research yourself, but helping people define models to  
4 get better sort of test methods.

5 I think -- and this alludes to what Becky was  
6 saying, in a way -- if there could be research into the  
7 actual emissions from these products, so that, as we go back  
8 and say, "Here's what our priorities are," we're looking,  
9 and say, "Okay. While our priority is -- while we're  
10 looking at the aquatic environment, is it really getting to  
11 the aquatic environment, or are just assuming that it could?  
12 If we could have test methodology that says, "Here's how you  
13 can show that it's being kept away from the aquatic  
14 environment," that's as good as saying it's safe in the  
15 aquatic environment.

16 So that might be another area of research, and  
17 then I'd also encourage -- and this kind of goes back to  
18 cost viability, long-range, is, as methods are developed, if  
19 you could partner with someone like OECD, where, if people  
20 run the test to fill some of the data gaps with our AAs  
21 here, that we could turn around and use those on a global  
22 basis, because they would be acceptable in all OECD  
23 countries.

24 PANEL CO-CHAIR FONG: Thanks very much, Mike.  
25 Kelly.

1           PANEL CO-CHAIR MORAN: Thank you. I'm going to  
2 start with about influencing the research agenda, and then  
3 talk about some specific ideas.

4           I've had some success with this in the past. I've  
5 staffed a joint effort between the water boards and  
6 municipalities to try to address pesticide water pollution,  
7 and we have zero research dollars, zero, and we've actually  
8 been able to, by identifying priorities, stimulate quite a  
9 bit of data to come to in former efforts. It's been really,  
10 really a very interesting example.

11           Presentation to audiences at scientific  
12 conferences has been a key tool for that. Journal articles  
13 are always useful, harder and more labor-intensive to  
14 achieve. Sometimes journals have places for non-scientific  
15 articles.

16           Elaine has mentioned that, the introductory pieces  
17 in her journal, SETAC journal, *Environmental Toxicology and*  
18 *Chemistry*, has a place for broader-perspective pieces that  
19 would be perfect for laying out the relevant parts of some  
20 kind of agenda here. So those articles are not as intensive  
21 as doing a full scientific paper. You don't have to create  
22 new research. You can tell a story, and say, "Here are some  
23 objectives that we have," and really communicate it out. I  
24 still think on your web site is always useful.

25           A key thing is to, through that networking, let

1 people know that, when they're applying for grants on  
2 something that's a priority for you -- you know, if you can  
3 send support letters for those grants, it makes a huge  
4 difference in the success of that, to have the State of  
5 California Department of Toxic Substances Control say, "Hey.  
6 This is a priority for us, and here's somebody doing a grant  
7 that will do that." So there's ways of doing things that  
8 are short of actually paying for the research, and I know  
9 everyone is keenly aware of the funding limitations here.

10           On to some specific things. For me, one of the  
11 biggest gaps that I've noticed since the beginning of this  
12 process, when you were writing the regulations, is that  
13 there aren't authoritative lists for nonhuman health hazard  
14 priorities. You know, we have the 303D list from the Clean  
15 Water Act, and not much else to point to in that area.

16           I think that it would not be particularly  
17 difficult, but it would be very interesting to see academics  
18 tackle this question with regard to aquatic and other kinds  
19 of organism classes. So aquatics is the easiest one to  
20 start with, but birds, amphibians, plants, so thinking about  
21 particularly organism types that won't be protected by the  
22 mammalian focus we have on humans.

23           You know, for example, someone could create a list  
24 of chemicals that have acute or chronic toxicity in aquatic  
25 organisms at a concentration below 100 nanograms per liter,

1 and that would be a really interesting set of chemicals, you  
2 know, based on available data and so forth.

3 A lot of these authoritative lists started by  
4 somebody first going out, some academic going out, and  
5 creating a list, and then it would get traction, and maybe  
6 another group would create a slightly different focus on the  
7 list, and eventually a government agency might pick up that  
8 concept. So I'm not seeing that that would happen tomorrow  
9 and move immediately into a regulatory list, but more that  
10 it would help us start to organize our thinking.

11 The other reason that's important, particularly  
12 when you look at endpoints that are less tested, like birds,  
13 so the avian toxicity, trying to just gather together  
14 chemicals is an earlier step towards development of ecotox  
15 methods. You know, is there anything we can learn about the  
16 kinds of chemicals that area associated with harm to classes  
17 of organisms? That's how we're going to work towards being  
18 able to use predictive methods, because we are moving away  
19 from animal testing.

20 You know, nobody is testing birds on a widespread  
21 basis, because no one wants to kill birds. You know,  
22 killing aquatic invertebrates is still okay, but killing  
23 birds is not. It's just not societally acceptable. So we  
24 don't do those testings, and that's part of why we don't  
25 have those data. So we have to figure out what's our way of

1 getting past that gap.

2           So having some sort of list of chemicals that are  
3 harmful to nonhuman organisms is something that -- it's a  
4 low-cost thing, and it's something that would be super,  
5 super exciting to see folks start to do.

6           The second one is developing better monitoring  
7 data. I'm going to focus in on aquatic monitoring data,  
8 surface water monitoring data, for chemicals on DTSC's list.  
9 There's a lot of hunger to do monitoring, and a lot of lack  
10 of focus on what chemicals to monitor. I find, in  
11 particularly emerging contaminants monitoring and other  
12 monitoring programs, people are always looking for "What  
13 chemicals should I do?"

14           So a first step on that would be to perhaps do a  
15 review of the chemicals list, focusing in on which chemicals  
16 have the greatest aquatic toxicity and which ones have use  
17 patterns that are outdoors. You know, what do we know about  
18 that? Can we come up with a list of 20, 30, 50 chemicals  
19 that seem like they would be particularly interesting to  
20 have monitoring data in surface water?

21           That's an exercise -- I have done that for  
22 pesticides, where the data are a little more rich, so it's  
23 easier to do and can be done for thousands and not tens of  
24 thousands of dollars. So it would be a more complicated  
25 exercise with the chemicals list, but once you have any kind

1 of list, with any basis whatsoever, then you can ask the  
2 question, "Are there chemical analysis methods out there?,"  
3 and encourage people to develop those methods.

4           If people know it's interesting to monitor for  
5 that chemical, they're much more likely to develop the  
6 chemical analysis method, and then it's possible to  
7 encourage people to actually do that monitoring. So, for  
8 example, the USGS National Water Quality Assessment Program,  
9 I've stayed in close contact with them over the years over  
10 pesticides.

11           So, through my work, I've identified pesticides  
12 that I think are the next one to pollute water, and have  
13 been able to tell them, "Hey. We really need methods with  
14 pyrethroids. We really need methods with fipronil. We need  
15 methods for indoxacarb." And they knew that.

16           They had a few years, and they developed those,  
17 and added them to their suite of methods, and now we're  
18 getting monitoring data nationwide. They have the capacity  
19 to measure other kinds of chemicals, and particularly if  
20 they know there's an agency that has a need or there's a  
21 public policy question.

22           So, you know, right now isn't the best time to  
23 suggest a whole lot of new work for NAWQA, but this is a  
24 long-term thing, and they do really powerful and amazing  
25 monitoring, you know, probably more than anybody else, but

1 also signaling out there for wastewater monitoring, for our  
2 water boards' monitoring. That's really important.

3 Another thing we can do in that area is, when your  
4 research identifies a candidate chemical that doesn't have  
5 very many uses, but that is used in a way like outdoors and  
6 buildings, or uses directly in water, that doesn't have a  
7 lot of uses, those are really good candidates for  
8 monitoring, so looking for that in the literature and seek  
9 to prove that link.

10 I really strongly encourage DTSC to start a  
11 conversation with the water boards over monitoring programs,  
12 and the needs for priorities for types of data that would be  
13 useful. DPR and the water boards have been doing this for a  
14 while, and DPR has restructured its surface water monitoring  
15 programs as a result, and it's learned about how those data  
16 are useful.

17 Now the water board is looking at restructuring  
18 permethrin monitoring programs, is working towards that for  
19 urban runoff and integrating that with the DPR programs and  
20 its own swamp program. So I see that potential happening  
21 through the example of pesticides, and think that that's  
22 something that DTSC is probably at the point in its  
23 regulatory program development to be ready to start that  
24 conversation with the water boards.

25 We really need -- so that's all related to

1 monitoring data, basically some steps and ideas. The third  
2 area is true source identification. So we know there's a  
3 chemical that we care about. We know it appears in the  
4 environment, and we don't have a lot of linkage information.  
5 There is some use information out there.

6           We've talked about data sources and data mining  
7 and so forth, but very few chemicals have had people  
8 actually sit down and using engineering estimation methods  
9 and scientific literature to go back and figure out what  
10 those sources are.

11           So I've personally worked on copper and zinc and a  
12 slew of other chemicals. Actually, I'm looking at  
13 wastewater specifically and trying to get some estimates,  
14 and sometimes you can do really well, and sometimes you  
15 can't.

16           The methods out there are -- there's a lot of  
17 really, really, crummy work, and there's only a little bit  
18 of work that's really scientifically robust in this area,  
19 where people are actually using the scientific literature  
20 and engineering estimation, not that involve, you know,  
21 assessment of uncertainty and bracketing the range of  
22 potential contributing sizes, and there's only a few people  
23 I know who do this.

24           Part of the reason this is important is that, if  
25 those methods are well developed and published into the

1 literature, I think we'll get more, better studies, but  
2 there's basically nothing that's been published in journals  
3 that's really good in this area.

4 I'm sorry to be so negative, but I'm super  
5 frustrated with the quality of what I see. People see  
6 something on a shelf and talk about it as "the main source  
7 of this," and there's just so much garbage in this area.

8 So source identification, true source  
9 identification, and really just starting with the  
10 literature, and that actually helps identify the gaps and  
11 needs for more specific studies, some of the kinds of  
12 measurements that other folks have talked about.

13 Then the fourth area I think we've all hit on,  
14 addressing the data gaps and uncertainty in ecotoxicity, you  
15 know, what can we do to do that as we're approaching AAs?  
16 And there I see a multi-step thing. I think there are some  
17 very specific short-term improvements that can be made to  
18 common tools.

19 There's already improvements being made by Green  
20 Screen, Safer Choice, you know, the common tools, Scivera  
21 (phonetic), other common tools that are out there. I think  
22 there are some things -- I've made lists of those and shared  
23 them in the past -- that could be done to already make  
24 things better, based on available information.

25 I do think there's a need to make sure that the

1 databases that are out there are really fully accessible.  
2 The EPA ECOTOX database is the main database source, but  
3 it's better coverage in aquatic toxins and some other areas,  
4 and so I'm not sure if everything that we really need is  
5 really assembled well in databases. There certainly need to  
6 expand (sic) and improve predictive ecotoxicology, and I  
7 think EPA has invested a lot of that when it comes to  
8 aquatic tox, but not any of the other areas.

9           Then, again using that same thing about chemical  
10 priorities, you know, really looking at the candidate  
11 chemicals list and seeing which ones are the ones that are  
12 most important in terms of exposure potential, we're seeing  
13 a lot, in a lot of different areas.

14           We should be encouraging very specific and  
15 targeted testing, particularly for aquatic organisms, on  
16 some chemicals, and we tend to come to the same chemicals  
17 and say, "Well, they're out there, but we don't know what  
18 they mean," but there's nobody actually making a list and  
19 signaling, "Gee. We really need data on these chemicals."

20           This is another thing where I've been amazingly  
21 successful, just by going out there and saying, "These  
22 chemicals are out there, and we know they're going to be out  
23 there, and we've got some pretty serious data gaps, so we  
24 don't know if they matter." Scientists will say, "Gee.  
25 I'll find this little bit of funding, and cobble together

1 this other bit of funding, and publish a paper."

2 So those are my four, and I also want to give my  
3 great thanks for having this topic on the agenda.

4 PANEL CO-CHAIR FONG: Kelly, thank you very much  
5 for sharing your experience and expertise with the panel and  
6 with DTSC.

7 So the only thing I want to touch on, it's perhaps  
8 providing some comment on how DTSC can maximize its  
9 influence on the research agenda, given its very limited  
10 resources. I think perhaps DTSC can take full advantage of  
11 the fact that the Safe Consumer Products Program is just so  
12 recognized around the world as being a trailblazer in green  
13 chemistry regulations. So that comes up a lot when I talk  
14 to different trade associations and public/private-type, you  
15 know, research organizations. So I think that's something  
16 that you can really take advantage of, so let me give you a  
17 very specific example.

18 So I don't know if the Dutch government has  
19 contacted DTSC, but the Dutch government is actually seeking  
20 help to help them set research directions on safe designs of  
21 chemicals, materials, and products, and finding alternatives  
22 for hazardous chemicals in products.

23 So, again, when I've spoken to, you know,  
24 different government agencies and industry associations,  
25 everybody just references the fact that your program is a

1 trailblazer, and it's doing something that other regulations  
2 are not. So I think there's a lot of interest and  
3 recognition out there about what's going on here. So I  
4 think, if you try to take full advantage of that, it's going  
5 to lead to more collaboration that's not resource-intensive.

6           In terms of, you know, how to, I guess, sell why  
7 collaboration is good, I think, if you can somehow talk  
8 about how you can add value to public/private research and  
9 development, the importance of what you're doing in terms of  
10 helping and supporting global competitiveness, I think that  
11 sells really well, and if you can actually also touch on the  
12 issue of green economy, I think that also helps in terms of  
13 selling, you know, collaboration, because the idea, you  
14 know, when the Green Chemistry Initiative first came out,  
15 was that there would be, you know, a lot of creating  
16 momentum to create a green economy and green jobs, and that  
17 hasn't really happened as much as people had hoped. So I  
18 think, if you were to emphasize how you can actually make  
19 that happen, that would also sell this collaboration.

20           Let me just ask if there are additional comments  
21 about DTSC's research agenda, and I'll start with Elaine.

22           PANEL MEMBER COHEN-HUBAL: Thank you. I think  
23 people's ideas were really -- you know, stimulated my  
24 thinking, so just a couple little additional things to kind  
25 of throw out. I did not raise these two possible tools in

1 terms of prioritization, because I still think they're on  
2 the research sort of side of the house, and I know the  
3 quantitative structure use relationships -- you're familiar  
4 with that paper, and the tool and model that ORD is  
5 developing in that area, but I think that's something that  
6 has potential to start being used in your prioritization of  
7 product chemical combinations.

8           So we talked about this yesterday, and sort of  
9 fell off my mind today, but in terms of transformations in  
10 environmental systems, particularly aquatic systems, we do  
11 have a chemical transformation simulator, and so exactly  
12 which transformation, you know, what the library is right  
13 now that's in there, and how -- it's certainly publicly  
14 available. It's not easily accessible. So we would have to  
15 just -- all you have to do is talk to the developers in our  
16 lab.

17           Two, driving which libraries they add and which,  
18 you know, things -- I think there's potential there for you  
19 to both access and use the tool, but then, also, potentially  
20 inform sort of what are the next kind of priority areas that  
21 they might want to focus on in their development.

22           On the product testing, sort of on the end side of  
23 your program, I do think there are -- we're certainly  
24 working on methods. Again, I mentioned a particular paper  
25 that's, I think, published or just barely there, but having

1 rapid -- you know, the rapid ability to just grind up a  
2 product and rapidly screen it, it becomes more powerful when  
3 you're looking for something specific, right, because the  
4 criticism of using that method on the side of trying to  
5 figure out what might be in there, and why it might be a  
6 problem, is criticized because, well, we don't really know  
7 that it would come out of the matrix and be an issue, right?  
8 But you've already identified something that was supposed to  
9 be eliminated, so it's a perfect screen, you know, after the  
10 fact, and very affordable, right? So that kind of thing  
11 could be built in.

12           Then, just on the emission rates, I thought there  
13 was a really -- so I'm actually working with somebody in  
14 Virginia Tech who, you know, is an expert in this area and  
15 approached me because, again, of the rapid chemical safety  
16 kinds of things we do, and I did flip it and say, "Well, you  
17 are aware of the DTSC program, aren't you?" And, of course,  
18 he wasn't.

19           So I do think that this is -- I'm taking this away  
20 as something, you know, that is a research priority, and  
21 that there's possibilities, too, that, you know, we could  
22 identify somebody on your team who should be a coauthor on  
23 sort of -- right now, I think it's kind of a scooping review  
24 type of paper, but I think there's -- like, I know that, on  
25 this panel, a lot of us are hearing these things, and where

1 maybe your group doesn't have the bandwidth to do their own  
2 papers on all kinds of things, it would be interesting to  
3 start doing more kind of joint authorship on some things  
4 that we all know are really important.

5 PANEL CO-CHAIR FONG: Ann.

6 PANEL MEMBER BLAKE: I just wanted to respond to  
7 Meredith's request earlier for specific contact, and since  
8 you brought up the Dutch government, I will say that folks  
9 that are working on the BPA and PFAS test methods are led by  
10 Anne Marie Vinggaard at the National Technical University of  
11 Denmark Food Institute, and I know that someone on your  
12 staff is already somewhat aware of that, but, you know,  
13 they're developing, I think, some nontargeted analysis in  
14 spectral libraries around that, too.

15 PANEL CO-CHAIR FONG: Thank you.

16 Jack.

17 PANEL MEMBER LINARD: I alluded to this earlier,  
18 but a number of companies, many companies, actually  
19 supported the original Green Chemistry Initiative, including  
20 mine. I wrote our note of support, so I know we did. We  
21 have a vested interest in making it work. So it's not an  
22 adversarial relationship. It's one where we want to make  
23 sure that, when we say we support it, we want to support it,  
24 and we want to make it work.

25 So, again, don't hesitate to bring us into the

1 fold. That's why I'm here. That's why Mike is here. So  
2 it's not that, you know, you're regulating -- we actually  
3 want to make it work, too, because it's all going to benefit  
4 all of us. So I just think -- you know, just want to make  
5 that clear, that we supported it. We still do. We want to  
6 see it work.

7 PANEL CO-CHAIR FONG: Great. I think that's a  
8 really good comment to end on, unless there -- I just want  
9 to emphasize, again, this is just the beginning of a  
10 long-term conversation, but I think we're off to a really  
11 good start, and at this point, I'm going to turn the mike  
12 over to my co-chair, Kelly, who is going to help us wrap up  
13 this meeting.

14 PANEL CO-CHAIR MORAN: All right. Thank you very  
15 much. So first, just in summary, I think today you all  
16 provided some really good discussion and input on the work  
17 plan, but I think the panel pretty well concluded that the  
18 work plan is solid. It's scientifically sound in its basis,  
19 so that's one of our jobs that we should be doing.

20 We did highlight a few things, particularly the  
21 worker safety issue, that the department is going to be  
22 pondering coming up, and we also just heard some very robust  
23 set of ideas to see the department's thinking through of  
24 research agendas.

25 I was hoping that we'd be able to do some sort of

1 prioritization, but I think there were so many good thoughts  
2 here that that probably is beyond the scope, but perhaps  
3 something the department will consider and, if they want to  
4 bring back to us, that we would have future conversations  
5 about. There's so many different things that fall into  
6 different pieces with different potential partners, that  
7 it's okay to have a multi-faceted agenda, in any case.

8           More importantly, it's sort of bigger picture. At  
9 the beginning of the meeting, I reviewed our charge from the  
10 legislature, and I just want to thank you all, because I  
11 think we are continuing down the course that they set for  
12 us, to talk about issues, you know, big and small, really  
13 ask questions about the science and policy issues around the  
14 program, you know, keep encouraging the staff to stick with  
15 the course of developing a solid, scientifically strong  
16 regulatory program.

17           We all lament that there isn't more money, and  
18 more staff, and, you know, more resources to do a lot of  
19 these things. I think that's an underpinning of the whole  
20 conversation here. So I do feel obligated to mention that.  
21 This is a tiny program that's -- it's like, you know, the  
22 mouse changing the world, and it is really doing that. I  
23 think it would have more capacity in a lot of different ways  
24 if there were more funds available, including funds for  
25 research program and more staff and so on, but that's

1   neither here nor there.  It's just something that's  
2   out there.

3               So I think that's really important, and I just  
4   want to check in.  I think that folks are -- what I'm  
5   hearing in all of this discussion is a lot of support for  
6   the way the program is going.  I've never heard anyone utter  
7   any major concerns about science or the basis for this work.  
8   So that's important for us to check in on regularly.  The  
9   DTSC Independent Review Panel and the legislature are asking  
10  us these kinds of questions, and a subset of us have  
11  represented the panel in those settings.

12              So I do want to make sure that panelists recognize  
13  that it is important for us to continue to think those  
14  things through.  If you do ever have concerns, your first  
15  phone call should be to Meredith, but if any way you're  
16  dissatisfied with stuff, as your co-chairs, Art and I are  
17  appropriate folks to contact, so that we can work with  
18  Meredith.  But I think everyone has a pretty open door with  
19  Meredith, and I certainly hope that you will continue with  
20  that.  But, not hearing any concerns, I don't think that's a  
21  big thing at the moment.

22              I'm not sure -- I don't think there's any other  
23  wrap-up stuff.  So you know about your logistics, and I'm  
24  going to start, and then I'll let everyone else here follow  
25  up, by thanking each and every one of the panelists for your

1 time, the thoughtful preparation work that you did, the  
2 experiences that you've individually brought to this, and  
3 your strong and longtime support for DTSC. That's really  
4 incredible.

5 Then I also want to thank all of the staff in the  
6 program. This is a really small program that's really doing  
7 a lot, and each of your individual contributions is what  
8 makes this successful. So it's individual parts. It's  
9 teamwork.

10 I want to thank the support staff for the meeting,  
11 and everyone up and down there. This has been, I think, a  
12 really smooth-flowing meeting, and very convenient to be a  
13 panelist, because of all the support.

14 I want to thank the partners and stakeholders for  
15 taking the time to listen in, and also provide your input  
16 through all the separate processes, because I can hear how  
17 that matters in the policy perspective, and how much  
18 information is being shared with the department, which is  
19 just crucial to its success.

20 So I'll pass it to Art and Meredith.

21 PANEL CO-CHAIR FONG: Nothing to add. Just, great  
22 job, you guys.

23 DEPUTY DIRECTOR WILLIAMS: So we're now showing a  
24 slide of our parking lot issues. Is there more than one  
25 slide? Yes. So I'm not going to read all the ones. I'm

1 just going to give you a second to take a look at those,  
2 maybe a minute on this slide and then a minute on the next  
3 one. Okay. Could we see the next slide, please? Anything  
4 else? Is that the last one, Baoku? No. Thank you.

5 I think, again, the fact that we got  
6 recommendations that were so clear and actionable and  
7 thoughtful, and aligned with what we're trying to do, is  
8 very, very helpful and valuable. I want to echo all the  
9 thanks that Kelly gave. I do want to thank the operations  
10 and admin support, Baoku Her, Valerie Ruvalcaba, because I  
11 know a lot of you interact with her, Debra Lynn-Shimasaki,  
12 and Heather Kessler for a lot of the administrative support,  
13 in particular.

14 I also want to highlight the work of Diana Phelps  
15 and Anne Cooper Doherty. Anne Cooper took on this role on  
16 top of some other very significant responsibilities, and  
17 really was pivotal in shaping this meeting, and working with  
18 Art and Kelly to hone the topics and ensure that we could  
19 have some thoughtful discussion. So I really want to thank  
20 you, Anne Cooper, for all of that work.

21 The staff who presented were representatives of  
22 the great staff that we have, and they're pretty great  
23 representatives, and I do think they do represent the depth  
24 and the breadth of the talent we have, and their commitment  
25 to the work, and the excellence that they bring to the work

1 every day.

2           So I couldn't be more privileged to work with  
3 them, and I couldn't be more privileged to work with you. I  
4 know you mostly know my back story, but, every now and then,  
5 I just still have to pinch myself that I've been given the  
6 opportunity to do this work, and this last couple days was  
7 no less amazing in terms of realizing -- you know, we have  
8 been very "nose to the grindstone," and to hear you all  
9 saying repeatedly that we are having an influence out in the  
10 world is -- I constantly tell staff that I'm the one who  
11 gets to go out into the world and see that, but hearing it  
12 from you is a different matter, and we really appreciate  
13 your bringing that back to us.

14           Going back to the metaphor, the fish metaphor, of  
15 going from fingerlings to juveniles to fully grown steelhead  
16 that are strong enough to make it through, you know, the  
17 pools and the ripples and the rapids, and get upstream and  
18 continue to spawn, I to think that we are getting there, and  
19 I do think that that's very much a tribute to this committee  
20 and the work of the panel in terms of not just advising us,  
21 not just cheerleading us, but also challenging us,  
22 challenging us to take on more, to do more, to realize the  
23 potential of these regulations, and so I think you for that,  
24 also.

25           So it's been a really great couple of days for us,

1 and I hope it has been for you, too.

2 PANEL MEMBER BLAKE: Can we also say thank you to  
3 our co-chairs for keeping us in line, keeping us focused,  
4 and moving us forward.

5 DEPUTY DIRECTOR WILLIAMS: Yes.

6 PANEL MEMBER BLAKE: Thank you, Art and Kelly.

7 DEPUTY DIRECTOR WILLIAMS: Once again. And,  
8 again, we rely on them for not just the meeting, but in  
9 terms of the multiple, multiple calls we have to try to  
10 shape the discussion. You're always so thoughtful, and,  
11 again, challenging, but encouraging. So you must have been  
12 great parents.

13 PANEL CO-CHAIR MORAN: Well, thank you all. This  
14 meeting is adjourned.

15 (Thereupon, the Meeting was  
16 adjourned at 12:27 p.m.)
